the fundamentals of scientific research an introductory laboratory manual is a laboratory manual geared towards first semester undergraduates enrolled in general biology courses focusing on cell biology this laboratory curriculum centers on studying a single organism throughout the entire semester serratia marcescens or s marcescens a bacterium unique in its production of the red pigment prodigiosin the manual separates the laboratory course into two separate modules the first module familiarizes students with the organism and lab equipment by performing growth curves lowry protein assays quantifying prodigiosin and atp production and by performing complementation studies to understand the biochemical pathway responsible for prodigiosin production students learn to use microsoft excel to prepare and present data in graphical format and how to calculate their data into meaningful numbers that can be compared across experiments the second module requires that the students employ uv mutagenesis to generate hyper pigmented mutants of s marcescens for further characterization students use experimental data and protocols learned in the first module to help them develop their own hypotheses experimental protocols and to analyze their own data before each lab students are required to answer questions designed to probe their understanding of required pre laboratory reading materials questions also guide the students through the development of hypotheses and predictions following each laboratory students then answer a series of post laboratory questions to guide them through the presentation and

analysis of their data and how to place their data into the context of primary literature students are also asked to review their initial hypotheses and predictions to determine if their conclusions are supportive a formal laboratory report is also to be completed after each module in a format similar to that of primary scientific literature the fundamentals of scientific research an introductory laboratory manual is an invaluable resource to undergraduates majoring in the life sciences

one of the most universal functions of any scientific or engineering laboratory is the gathering of data to provide answers to immediate questions or information to be filed for future reference such data gathering may be achieved in various ways depending on the nature and quantity of the information the most prevalent of such data gathering methods is undoubtedly analog recording electrical analog recorders are available in a variety of sizes speeds sensitivities and prices they are suitable for recording any signal which is in or can be converted to electrical form these recorders are found in every modern laboratory without them the importance of many functional relations would be missed altogether how could one adequately diagnose a heart ailment without a cardiographic recorder or obtain infrared or magnetic resonance spectra on any practicable basis without a strip chart recorder true various curves that are now traced automatically with a recorder can be plotted manually from point by point measurements this procedure however is not only time consuming but may cause valid bits of information to be overlooked entirely simply because the points were taken too far apart another factor favoring the use of recorders is the ability to pinpoint faulty operation of the data gathering system artifacts that might not be observable at all in point by point observations 1 the laboratory recorder 2 will often be readily identifiable on a recording asymmetry of a peaked curve for example is only dearly evident in a recording

this highly original work presents laboratory science in a deliberately skeptical way as an anthropological approach to the culture of the scientist drawing on recent work in literary criticism the authors study how the social world of the laboratory produces papers and other texts and how the scientific vision of reality becomes that set of statements considered for the time being too expensive to change the book is based on field work done by bruno latour in roger guillemin s laboratory at the salk institute and provides an important link between the sociology of modern sciences and laboratory studies in the history of science
