Novel and Emerging Therapies for the Treatment of Obesity and Related Disorders 2024-05-06 defining the lung cancer problem 1 lung cancer is the leading cause of cancer death in the world it kills almost as many americans as cancers of the breast prostate colon rectum pancreas and 2 kidney combined and accounts for 28 6 of all us cancer deaths with an increase in the 5 year relative survival rate from 13 to only 16 in the more than 2 30 years from 1974 to the present it will take us another 840 years to eradicate lung cancer deaths if we do not improve the current rate of progress as discussed in this text lung cancer prevention has received substantial att tion the decrease in smoking in recent decades has helped but smoking is not the only problem lung cancer in people who have never smoked is currently the 5th 3 leading cause of cancer death in the united states several factors contribute to the lethality of lung cancer including the rapidity of tumor growth advanced stage at diagnosis due to nonspecificity of early sy toms and the uncertain efficacy of screening early development of metastases and resistance to therapy several chapters in this book discuss new molecular targets that may be potentially exploitable in the future as well as discussing our track record to date in exploiting them

Melanoma 2008-08-08 although treatable with conventional and high dose therapies multiple myeloma mm remains incurable however recent advances in oncogenomics coupled with increased understanding of the role of the bone marrow bm microenvironment in mm pathogenesis has provided the basis for a new treatment paradigm targeting the tumor cell in the bm milieu to overcome conventional drug resistance and improve patient outcome this text will first describe advances in molecular pathogenesis of mm due to cutting edge comparative genomic hybridization gene microarray and proteomic profiling of mm cells the molecular basis for the growth survival drug resistance and migration of mm cells including extracellular matrix proteins bm stromal cells and cytokines in the bm milieu will next be delineated using both laboratory and animal model systems importantly recent advances in the pathogenesis of bone disease in mm will be described these preclinical studies all will set the stage for the bench to bedside translation of scientific advances to the clinic to improve patient outcome the clinical approach to patients with plasma cell dyscrasias has been transformed in the past 5 years there are now uniform definitions of monoclonal gammopathy of unclear significance and improved predictors of who will develop mm biologically based prognostic factors form the basis for new staging systems predictive of patient outcome the approach to the patient with newly diagnosed relapsed and relapsed refractory mm has been transformed with improved overall and extent of response as well as progression free and overall survival in both transplant candidates and elderly patients novel targeted therapies and immune based strategies hold great promise to enhance treatment options even further finally our ability to identify prophylax and treat complications of mm and its treatment has advanced in a parallel fashion myeloma therefore represents a novel treatment paradigm targeting the tumor cell tumor host interaction and tumor microenvironment which can serve as a model to outcome in patients with other hematologic cancers and solid tumors as well Dance 2017 this book reports on the latest technological and clinical advances in the field of neurorehabilitation it is however much more than a conventional survey of the state of the art in neurorehabilitation technologies and therapies it was formed on the basis of a week of lively discussions between curious phd students and leading research experts during the summer school on neurorehabilitation ssnr2012 september 16 21 in nuévalos zaragoza spain its unconventional format makes it a perfect quide for all phd students researchers and professionals interested in gaining a multidisciplinary perspective on current and future neurorehabilitation scenarios the book covers various aspects of neurorehabilitation research and practice organized into different parts the first part discusses a selection of common impairments affecting brain function such as stroke cerebral palsy and parkinson s disease the second deals with both spinal cord and brain plasticity the third part covers the most recent rehabilitation and diagnostics technologies including robotics neuroprostheses brain machine interfaces and electromyography systems practical examples and case studies related to the application of some of the latest techniques in realistic clinical scenarios are covered in the fourth part

Emerging Therapies in Neurorehabilitation 2013-08-31 for decades we have known that the overgrowth hardening and scarring of tissues so called fibrosis represents the final common pathway and best histological predictor of disease progression in most organs fibrosis is the culmination of both excess extracellular matrix deposition due to ongoing or severe injury

and a failure to regenerate an inadequate wound repair process ultimately results in organ failure through a loss of function and is therefore a major cause of morbidity and mortality in disease affecting both multiple and individual organs whilst the pathology of fibrosis and its significance are well understood until recently we have known little about its molecular regulation current therapies are often indirect and non specific and only slow progression by a matter of months the recent identification of novel therapeutic targets and the development of new treatment strategies based on them offers the exciting prospect of more efficacious therapies to treat this debilitating disorder this research topic therefore compromises several up to date mini reviews on currently known and emerging therapeutic targets for fibrosis including the transforming growth factor tgf family epigenetic factors angiotensin ii type 2 at2 receptors mineralocorticoid receptors adenosine receptors caveolins and the sphingosine kinase sphingosine 1 phosphate and notch signaling pathways in each case mechanistic insights into how each of these factors contribute to regulating fibrosis progression are described along with how they can be targeted by existing drugs small molecules or other mimetics to prevent and or reverse fibrosis and its contribution to tissue dysfunction and failure two additional reviews will discuss various anti fibrotic therapies that have demonstrated efficacy at the experimental level but are not yet clinically approved and the therapeutic potential vs limitations of stem cell based therapies for reducing fibrosis while facilitating tissue repair finally this research topic concludes with a clinical perspective of various anti fibrotic therapies for cardiovascular disease cvd outlining limitations of currently used therapies the pipeline of anti fibrotics for cvd and why so many anti fibrotic drugs have failed at the clinical level
