deep learning in introductory physics exploratory studies of model based reasoning is concerned with the broad question of how students learn physics in a model centered classroom the diverse creative and sometimes unexpected ways students construct models and deal with intellectual conflict provide valuable insights into student learning and cast a new vision for physics teaching this book is the first publication in several years to thoroughly address the coherence versus fragmentation debate in science education and the first to advance and explore the hypothesis that deep science learning is regressive and revolutionary deep learning in introductory physics also contributes to a growing literature on the use of history and philosophy of science to confront difficult theoretical and practical issues in science teaching and addresses current international concern over the state of science education and appropriate standards for science teaching and learning the book is divided into three parts part i introduces the framework agenda and educational context of the book an initial study of student modeling raises a number of questions about the nature and goals of physics education part ii presents the results of four exploratory case studies these studies reproduce the results of part i with a more diverse sample of students under new conditions a public debate peer discussions and group interviews and with new research prompts model building software bridging tasks and elicitation strategies part iii significantly advances the emergent themes of parts i and ii through historical analysis and a review of physics education research endorsements in deep learning in introductory physics latterly describes his extremely innovative course in which students ideas about motion are elicited evaluated with peers and revised through experiment and discussion the reader can see the students deep engagement in constructive scientific modeling while students deal with counter intuitive ideas about motion that challenged galileo in many of the same ways latterly captures students engaging in scientific thinking skills and building difficult conceptual understandings at the same time this is the double outcome that many science educators have been searching for the case studies provide inspiring examples of innovative course design student sensemaking and reasoning and deep conceptual change john clement university of massachusetts amherst scientific reasoning research institute deep learning in introductory physics is an extraordinary book and an important intellectual achievement in many senses it offers new perspectives on science education that will be of interest to practitioners to education researchers as well as to philosophers and historians of science latterly combines insights into model based thinking with instructive examples from the history of science such as galileo s struggles with understanding accelerated motion to introduce new ways of teaching science the book is based on first hand experiences with innovative teaching methods reporting student s ideas and discussions about motion as an illustration of how modeling and model building can help understanding science its lively descriptions of these experiences and its concise presentations of insights backed by a rich literature on education cognitive science and the history and philosophy of science make it a great read for everybody interested in how models shape thinking processes dr jürgen renn director max planck institute for the history of science

this book grew out of an ongoing effort to modernize colgate university s three term introductory calculus level physics course the book is for the first term of this course and is intended to help first year college students make a good transition from high school physics to university physics the book concentrates on the physics that explains why we believe that atoms exist and have the properties we ascribe to them this story line which motivates much of our professional research has helped us limit the material presented to a more humane and more

realistic amount than is presented in many beginning university physics courses the theme of atoms also supports the presentation of more non newtonian topics and ideas than is customary in the first term of calculus level physics we think it is important and desirable to introduce students sooner than usual to some of the major ideas that shape contemporary physicists views of the nature and behavior of matter here in the second decade of the twenty first century such a goal seems particularly appropriate the quantum nature of atoms and light and the mysteries associated with quantum behavior clearly interest our students by adding and phasing more modern content we seek not only to present some of the physics that engages contemporary physicists but also to attract students to take more physics only a few of our beginning physics students come to us sharply focused on physics or astronomy nearly all of them have never taken physics in high school and found it interesting

this is a companion textbook for an introductory course in physics it aims to link the theories and models that students learn in class with practical problem solving techniques in other words it should address the common complaint that i understand the concepts but i can't do the homework or tests the fundamentals of introductory physics courses are addressed in simple and concise terms with emphasis on how the fundamental concepts and equations should be used to solve physics problems
