of intelligent transportation systems itss namely
efficient information dissemination between vehicles
infrastructures pedestrians and public transportation
systems it covers the state of the art of vehicular ad
hoc networks vanets with centralized and decentralized
peer to peer communication architectures considering
several application scenarios with a detailed treatment
of emerging communication paradigms including cross
networking and distributed algorithms unlike most of
the existing books this book presents a multi layer
overview of information dissemination systems from
lower layers mac to high layers applications all those
aspects are investigated considering the use of mobile
devices such as smartphones tablets and embedded

automotive industry is no different with the future of its product development lying in the timely integration of these chiefly electronic and mechanical systems the integration activities cross both product type and engineering discipline boundaries to include chip embedded board and network vehicle level systems integration verification and validation of each of these three domains are examined in depth attesting to the difficulties of this phase of the automotive hardware and software system life cycle the current state of the art is to integrate verify validate and test automotive hardware and software with a complement of physical hardware and virtual software prototyping tools the growth of sophisticated software tools sometimes combined with hardware in the loop devices has allowed the automotive industry to meet shrinking time to market decreasing costs and increasing safety demands it is also why most of the papers in this book focus on virtual systems prototypes and models to emulate and simulate both hardware and software further such tools and techniques are the way that hardware and software systems can be co verified and tested in a concurrent fashion the goal of this compilation of expert articles is to reveal the similarities and differences between the integration verification and validation ivv of hardware and software at the chip board and network levels this comparative study will reveal the common ivv thread among the different but ultimately related implementations of hardware and software systems in so doing it supports the larger systems engineering approach for the vertically integrated automobile namely that of model driven development
