Access control in its simplest form involves identifying a user based on their credentials and then authorizing the appropriate level of access once they are authenticated. Passwords, pins, security tokens, and even biometric scans are all credentials commonly used to identify and authenticate a user. In physical security and information security, access control is the selective restriction of access to a place or other resource, while access management describes the process. The act of accessing may mean consuming, entering, or using permission to access a resource is called authorization. Access control management refers to the process of creating, implementing, and maintaining access control policies to protect digital resources such as data, applications, and systems. It involves defining user roles, assigning permissions, setting up authentication mechanisms, and monitoring access to resources.
