## **NASA Technical Note**

1907

sampled data models for linear and nonlinear systems provides a fresh new look at a subject with which many researchers may think themselves familiar rather than emphasising the differences between sampled data and continuous time systems the authors proceed from the premise that with modern sampling rates being as high as they are it is becoming more appropriate to emphasise connections and similarities the text is driven by three motives the ubiquity of computers in modern control and signal processing equipment means that sampling of systems that really evolve continuously is unavoidable although superficially straightforward sampling can easily produce erroneous results when not treated properly and the need for a thorough understanding of many aspects of sampling among researchers and engineers dealing with applications to which they are central the authors tackle many misconceptions which although appearing reasonable at first sight are in fact either partially or completely erroneous they also deal with linear and nonlinear deterministic and stochastic cases the impact of the ideas presented on several standard problems in signals and systems is illustrated using a number of applications academic researchers and graduate students in systems control and signal processing will find the ideas presented in sampled data models for linear and nonlinear systems to be a useful manual for dealing with sampled data systems clearing away mistaken ideas and bringing the subject thoroughly up to date researchers in statistics and economics will also derive benefit from the reworking of ideas relating a model derived from data sampling to an original continuous system

**2018 5**

1941

this volume gathers contributions reflecting topics presented during an indam workshop held in rome in may 2016 the event brought together many prominent researchers in both mathematical analysis and numerical computing the goal being to promote interdisciplinary collaborations accordingly the following thematic areas were developed 1 lagrangian discretizations and wavefront tracking for synchronization models 2 astrophysics computations and post newtonian approximations 3 hyperbolic balance laws and corrugated isometric embeddings 4 caseology techniques for kinetic equations 5 tentative computations of compressible non standard solutions 6 entropy dissipation convergence rates and inverse design issues most of the articles are presented in a self contained manner some highlight new achievements while others offer snapshots of the state of the art in certain fields the book offers a unique resource both for young researchers looking to quickly enter a given area of application and

for more experienced ones seeking comprehensive overviews and extensive bibliographic references
