this book is designed to provide the foundations for ontology engineering it is motivated by the ontology 101 tutorial given for many years at the semantic technology conference and then later from a semester long university class the book can serve as a course textbook or a primer for all those interested in ontologies ontologies have become increasingly important as the use of knowledge graphs machine learning natural language processing nlp and the amount of data generated on a daily basis has exploded as of 2014 90 of the data in the digital universe had been generated in the preceding two years and the volume of data was projected to grow from 3 2 zettabytes to 40 zettabytes in the following six years the very real issues that government research and commercial organizations are facing in order to sift through this amount of information to support decision making alone mandate increasing automation yet the data profiling nlp and learning algorithms that are ground zero for data integration manipulation and search provide less than satisfactory results unless they utilize terms with unambiguous semantics such as those found in ontologies and well formed rule sets ontologies can provide a rich schema for the knowledge graphs underlying these technologies as well as the terminological and semantic basis for dramatic improvements in results many ontology projects fail however due at least in part to a lack of discipline in the development process
