the experimental probability of an event is an estimate of the theoretical or true probability based on performing a number of repeated independent trials of an experiment counting the number of times the desired event occurs and finally dividing the number of times the event occurs by the number of trials of the experiment the main difference between theoretical and experimental probability is that theoretical probability expresses how likely an event is to occur while experimental probability characterizes how frequently an event occurs in an experiment the difference between theoretical and experimental probability is that theoretical is based on knowledge and mathematics experimental probability is based on trials or experiments theoretical and experimental chemistry is a journal dedicated to the rapid publication of research on modern chemistry problems links the advances of modern physical chemistry with the development of principles of chemical process control theoretical you do not actually conduct an experiment instead you use what you know about the situation to determine the probability of an event occurring you may use your reasoning skills or an existing formula to arrive at your answer experimental and theoretical probability understand and compare experimental and theoretical probability example a find the theoretical probability of obtaining doubles when rolling two number cubes b what is the experimental probability of roling doubles for 20 trials when you get 3 doubles in the 20 trials show step by step solutions lessons distinguishing between theoretical probability and experimental probability how to find and use experimental probability how to find the theoretical probability of an event how to use the formula for theoretical probability with video lessons examples and step by step solutions in an experiment it s good to know your sample space the sample space is the set of all possible outcomes of an experiment watch this tutorial to get a look at the sample space of an experiment what is probability probability can help you solve all sorts of everyday problems but first you need to know what probability is theoretical probability is what we expect to happen where experimental probability is what actually happens when we try it out the probability is still calculated the same way using the number of possible ways an outcome can
