early in the twentieth century arguments about nature and nurture pitted a rigid genetic determinism against the idea that genes were flexible and open to environmental change this book tells the story of three viennese biologists paul kammerer julius tandler and eugen steinach who sought to show how the environment could shape heredity through the impact of hormones it also explores the dynamic of failure through both scientific and social lenses during world war i the three men were well respected scientists by 1934 one was dead by his own hand another was in exile and the third was subject to ridicule paul kammerer had spent years gathering zoological evidence on whether environmental change could alter heredity using his research as the scientific foundation for a new kind of eugenics one that challenged the racism growing in mainstream eugenics by 1918 he drew on the pioneering research of two colleagues who studied how secretions shaped sexual attributes to argue that hormones could alter genes after 1920 julius tandler employed a similar concept to restore the health and well being of vienna s war weary citizens both men rejected the rigidly acting genes of the new genetics and instead crafted a biology of flexible heredity to justify eugenic reforms that respected human rights but the interplay of science and personality with the social and political rise of fascism and with antisemitism undermined their ideas leading to their spectacular failure
