challenging organized crime in the western hemisphere a game of moves and countermoves takes the unusual approach of exploring and describing how organized crime groups develop their capacities in response to heightened powers of law enforcement and how law enforcement in turn responds creating an ongoing dynamic interaction the book shows how a state such as the united states has and can develop new laws and practices in ways that enable them to deal with relatively large violent groups and yet preserve the rule of law and civil liberties while most texts describe organized crime groups and the challenges to government they impose from a static perspective the authors dissect the interaction over time of organized crime and democratic governance that has created the present structure and balance of advantages in the united states readers learn about the markets for contraband and extortionate protection that form the bulk of organized criminal enterprise the vulnerabilities of the traditional practices and rules of law enforcement the effects of globalization of criminal enterprises on their contest with the state the effectiveness of various

practices of law enforcement and the continuing forces of change often technological in the businesses of organized crime and law enforcement that play important roles in the contest between them this thought provoking book is ideal for students of organized and transnational crime in university programs and law schools as well as researchers and legal practitioners who seek to look beyond the simple traditional history of organized crime and develop a strategy to confront organized crime in the future

the youth of the ocean floors 0.3ma verses the age of plate tectonics 2.3 ma suggests strongly that plate tectonics is cyclic densified silicate liquid ls at about 290km depth suggests that it could be the ingredient that lightens the outer core as well as an active ingredient in its activities along with lower mantle phases high density magnesium provoskite mgpv calcium perovskite capv magnesiumwustite mw iron ir and iron liquid lm plus isobarically and isothermally invariant liquid phases unstable convective contacts among these phases at all

levels produce heat as they tend toward stable equilibrium this heat expands against the earth's mantle and even causes the inner core to melt with 5cc g eventually the core mantle boundary fails along lines and or points to allow for the exit of densified silicate liquid this liquid reacts with the lower mantle to produce unique liquids fofo for oceanic island basalts and c component for the ridge and rise basalts ofthe atlantic indian and pacific oceans it is thought that these ejected liquids react to form hot solid plumes of low viscosity that ascend to 290 km where they melt on decompression to basalt that ascends further to create oceanic crust sea floor spreading followed by subduction to the earth's core where the cycle ends to begin again and again a hypothetical ternary system is used to illustrate the cycle from beginning to end experimental evidence indicates that the core mantle boundary may be as simple as a quaternary reaction $mgpv + capv = mw + ls + lm$ where ls probably contains some fe_{2O_3}
