first published in 1988 this thought provoking volume offers a constructive critical analysis of family therapy for its neglect of the self in the system and provides a therapeutic approach to clinical problems that takes into account both individual and family dynamics the author shows that by elevating the metaphor of the system to dogma family therapy has lost sight of much of the richness and complicating influence of personal feeling motivation and conflict resulting in a proliferation of esoteric abstract theories and highly mechanistic technical interventions the self in the system describes a different reality that is often overlooked no matter how much their behavior is coordinated within the system family members remain separate individuals with private hopes and ambitions motives and expectations quirks and foibles and potentials for creative work this book

provides a unique approach that develops a better understanding of family members individual experiences and helps in enhancing their personal responsibility and ability to solve their own interactional problems within the family system the approach however is not just another version of psychoanalytic family therapy but rather one that utilizes the best tools of family therapy and the most useful ideas from individual psychology and psychodynamic psychotherapy chapters cover such important topics as finding the family and losing the self the problem of change working with interaction the effective use of empathy making assessments that include both the whole family system and the psychology of its members interactional psychodynamics a practical guide to object relations theory how to develop understanding and working with resistance

clinical epistemology has been a very prominent topic with the emergence of systems theory as a widely studied approach to understanding human behavior

with systemic perspectives have come therapy approaches which promise more immediate change than the dynamic therapies begun by the writings and clinical practice of sigmund freud some view systems and psychodynamic perspectives paradigms as exclusive of one another and even competitive in this concise book on the topic bauserman and rule express that clinicians were in fact ready to embrace and assimilate the systems perspective because the interactional theoretical orientation of the non freudians and other pioneers had led them precisely in that direction the authors show an evolutionary side to the issue and work to remove some of the discontinuity and acrimony between these two useful perspectives

in an attempt to cease from reducing the world and its emergent phenomena to linear modeling and analytic dissection dynamic systems theories dst and embodiment theories and methods aim at accounting for the complex dynamic and non linear phenomena that we constantly deal with in psychology for instance dst and embodiment can enrich psychology s understanding of the communicative process both in clinical and non clinical settings in psychotherapy an important amount of research has shown that next to other ingredients the therapeutic relationship is the most important active factor contributing to psychotherapy outcome these findings give communication a central role in the psychotherapy process in the traditional view the underlying model of understanding psychotherapy processes is that of a number of components summatively coming together enabling us to make a linear causal prediction yet communication is inherently dynamic a shift to viewing the communication process in psychotherapy as a field dynamic phenomenon helps us to take into account nonlinear phenomena such as feedback processes within and between persons we thus propose an embodied enactive dynamic systems view as a new theoretical and methodological perspective that can more realistically capture what happens among and between two persons in psychotherapy this view reaches beyond the current narrow model of psychotherapy research dst and embodied enactive approaches can offer solutions to the loss of non linear phenomena the complex dynamics of reality and the holistic level of analysis dst and embodied enactive approaches have developed not in a single discipline but in a joined movement based on various fields such as physics biology robotics anthropology philosophy linguistics neuroscience and psychology and have only recently entered clinical theorizing the two new paradigms have already triggered a rethinking of the therapeutic exchange by recognizing the embodied nature of psychological and communicative phenomena their integration opens up a promising scenario in the field of psychotherapy research developing new profoundly transdisciplinary theoretical concepts methodologies and standards of knowledge the notion of field dynamics enables us to account for the role of the communicational context in the regulation of intra psychological processes while at the same time avoiding the pitfalls of an ontologization of the hierarchy of systemic organization moreover the new approach implements methodological strategies that can transcend the conventional opposition between idiographic and nomothetic sciences
