infection is a major cause of morbidity and mortality in patients with neoplastic disease because of compromised host defenses these defects result in an increased risk of infection and its complications the nature of the underlying malignancy the immunodeficiencies associated with it and the treatments directed against it are all important determinants of infection in recent years the introduction of more intensive chemotherapeutic regimes and the widespread use of bone marrow and peripheral stem cell transplantation have changed the pattern of infection in many patients

furthermore the increasing use of central venous access devices and antimicrobial prophylaxis has changed the epidemiology of infection in these patients as well the goal of this volume in the cancer treatment and research series is to emphasize that while the management of infection in cancer patients is common it is constantly changing with the increasing complexity of these patients optimal management requires a multidisciplinary approach ultimately it is hoped that this book will assist clinicians in the diagnosis management and prevention of infection in order to optimize care for patients with cancer
