this book deals with the present adverse effects of using precarious building materials on the ecology and human health also the detailed discussions on the novel and greener construction materials and their utilization as an alternative to the conventional harmful existing methods and materials are also presented in the subsequent chapters this book helps to fill the research gaps in the existing prior art knowledge in the field of sustainable construction and green building materials and methods giving due importance to ecology and health specifically to the fields of sustainable structural engineering sustainable geotechnical engineering sustainable road engineering etc this book helps in achieving a sustainable environment through possible adoption of innovative and ecological construction practices hence this book acts as a practical workbook

mainly for the academicians and practicing engineers who are willing to work toward the consecrated building industry it is a well established fact that the constructions of the engineering structures consume more and more earth resources than any other human activities in the world in addition the construction related activities will produce several million tons of greenhouse gases toxic emissions water pollutants and solid wastes this creates a huge impact on environment and causes severe health issues on humans and animals it is thus important to create an eco friendly construction environment which can satisfy the ecological and health requirements
