Bubbly Flows *2012-12-06*

the book summarises the outcom of a priority research programme analysis modelling and computation of multiphase flows the results of 24 individual research projects are presented the main objective of the research programme was to provide a better understanding of the physical basis for multiphase gas liquid flows as they are found in numerous

chemical and biochemical reactors the research comprises steady and unsteady multiphase flows in three frequently found reactor configurations namely bubble columns without interiors airlift loop reactors and aerated stirred vessels for this purpose new and improved measurement techniques were developed from the resulting knowledge and data new and refined models for describing the underlying physical processes were developed which were used for the establishment and improvement of analytic as well as numerical methods for predicting multiphase reactors thereby the development lay out and scale up of such processes should be possible on a more reliable basis
