carbohydrate chemistry provides review coverage of all publications relevant to the chemistry of monosaccharides and oligosaccharides in a given year the amount of research in this field appearing in the organic chemical literature is increasing because of the enhanced importance of the subject especially in areas of medicinal chemistry and biology in no part of the field is this more apparent than in the synthesis of oligosaccharides required by scientists working in glycobiology glycomedicinal chemistry and its reliance on carbohydrate synthesis is now very well established for example by the preparation of specific carbohydrate based antigens especially cancer specific oligosaccharides and glycoconjugates coverage of topics such as nucleosides amino sugars alditols and cyclitols also covers much research of relevance to biological and medicinal chemistry each volume of the series brings together references to all published work in given areas of the subject and serves as a comprehensive database for the active research chemist specialist periodical reports provide systematic and detailed review coverage in major areas of chemical research compiled by teams of leading authorities in the relevant subject areas the series creates a unique service for the active research chemist with regular in depth accounts of progress in particular fields of chemistry subject coverage within different volumes of a given title is similar and publication is on an annual or biennial basis

this book provides a comprehensive analysis of biominerals in particular phosphates and carbonates of calcium the book begins with a discussion of the theories of solid state chemistry and thermodynamics of ionic solid solutions and applies these theories to show how physiological constituents like sodium magnesium carbonate chloride fluoride lead or strontium influence the formation stability and solubility of calcium phosphates the results of this discussion are then applied to a critical evaluation of data regarding minerals in bone dentin and tooth enamel their formation during growth and turn over their stability under physiological conditions and their breakdown under pathological conditions these principles are also applied to pathological calcifications such as renal calculi arterial wall calcifications chondrocalcinosis dental calculus and salivary stones a similar approach is used as the authors discuss carbonations such as calcite dolomite and aragonite the book also includes an extensive analysis of the advantageous effects of magnesium supplementation the wealth of knowledge in this extensive treatise of biominerals is valuable to medical dental and ecological biologists as well as

this book is devoted to the investigation of a rather prevalent process in nature interaction of atoms with electromagnetic radiation primary attention is given to the low and intermediate photon energy region from tens to hundreds of electron volts it is in this region that the probability of photon absorption and photoionization is largest data in this energy region are very interesting and useful in astrophysics and plasma physics solid state physics and quantum electronics and in a number of other branches of science and technical applications formulae for hydrogen atom photoionization are given in almost all textbooks on quantum mechanics together with the limited amounts of experimental data available up to the beginning of the sixties the formulae gave an impression of the completeness of the study of photoionization of the absolute clarity of the mechanism of the process and of the possibility of calculating rather easily its probability using the formulae

the concept of general oxidoreductase function at the plasma level is new oxidoreduction at the plasma membrane relation to growth and transport provides the first truly comprehensive coverage of the oxidoreduction reactions in plasma membranes and the role that can now be attributed to these enzymes in controlling growth and other cell functions in plants and animals the book describes the nature and orientation of oxidoreductases in plasma membranes the stimulation of cell growth by oxidants reacting with transplasma

membrane electron transport changes in enzymes in tumor cells and the basis of the growth effects and oxidoreductase stimulation of membrane transport in relation to known second messenger functions such as cellular ph changes calcium transport protein phosphorylation and oxidation levels of pyridine nucleotides the book then examines the significance of these enzymes in cell culture tumor growth nerve transmission ion transport and membrane potential the book also presents a new approach to understanding the action of antitumor drugs and herbicides biochemists biologists oncologists cancer researchers physiologists and endocrinologists will find this an indispensable reference source as they conduct studies in this exciting new area
