recent years have seen a shift in the international development agenda in the direction of a greater emphasis on rights and democracy while this has brought many positive changes in womens rights and political representation in much of the world these advances were not matched by increases in social justice rising income inequalities coupled with widespread poverty in many countries have been accompanied by record levels of crime and violence meanwhile the global shift in the consensus over the role of the state in welfare provision has in many contexts entailed the down sizing of public services and the re allocation of service delivery to commercial interests charitable groups ngos and households gender justice development and rights reflects on this ambivalent record and on the significance accorded in international development policy to rights and democracy in the post cold war era key items on the contemporary policy agenda neo liberal economic and social policies democracy and multiculturalism are addressed here by leading scholars and regional specialists through theoretical reflections and detailed case studies together they constitute a collection which casts contemporary liberalism in a distinctive light by applying a gender perspective to the analysis of political and policy processes case studies from latin america sub saharan africa middle east east central europe south and south east asia contribute a cross cultural dimension to the analysis of contemporary liberalism the dominant value system in the modern world and how it exists and is resisted in developing and post transition societies

in this volume the author reviews the results of research on language performance and proposes a model of production and comprehension although recent developments in linguistics are taken into account consideration of other requirements of a performance model leads to the conclusion that the grammar the speaker has in mind differs from the grammar as currently conceived of by most linguists the author is also critical of recent computer simulations of language performance on the basis that they fall short of describing what goes on in human production and comprehension the author therefore proposes that the basic issues must be rethought and new theoretical foundations reformulated in order to arrive at a viable theory of language functioning in developing the framework of the model presented in this book requirements of flexibility in the performance mechanisms the probabilistic nature of comprehension processes and the interleaving of linguistic rules with context and knowledge of the world are emphasized

the first concern of scientists who are interested in synthetic polymers has always been and still is how are they synthesized but right after this comes the question what have i made and for what is it good this leads to the important topic of the structure property relations to which this book is devoted polymers are very large and very complicated systems their characterization has to begin with the chemical composition configuration and con formation of the individual molecule the first chapter is devoted to this broad objective the immediate physical consequences discussed in the second chapter form the basis for the physical nature of polymers the supermolecular interactions and arrangements of the individual macromolecules the third chapter deals with the important question how are these chemical and physical structures experimentally determined the existing methods for polymer characterization are enumerated and discussed in this chapter the following chapters go into more detail for most applications textiles films molded or extruded objects of all kinds the mechanical and the thermal behaviors of polymers are of pre ponderant importance followed by optical and electric properties chapters 4 through 9 describe how such properties are rooted in and dependent on the chemical structure more detailed considerations are given to certain particularly important and critical properties such as the solubility and permeability of polymeric systems macromolecules are not always the final goal of the chemist they may act as intermediates reactants or catalysts this topic is presented in chapters 10 and 11

this groundbreaking book offers a new and compelling perspective on the structure of human language the fundamental issue it addresses is the proper balance between syntax and semantics between structure and derivation and between rule systems and lexicon it argues that the balance struck by mainstream generative grammar is wrong it puts forward a new basis for syntactic theory drawing on a wide range of frameworks and charts new directions for research in the past four decades theories of syntactic structure have become more abstract and syntactic derivations have become ever more complex peter culicover and ray jackendoff trace this development through the history of contemporary syntactic theory showing how much it has been driven by theory internal rather than empirical considerations they develop an alternative that is responsive to linguistic cognitive computational and biological concerns at the core of this alternative is the simpler syntax hypothesis the most explanatory syntactic theory is one that imputes the minimum structure necessary to mediate between phonology and meaning a consequence of this hypothesis is a far richer mapping between syntax and semantics than is generally assumed through concrete analyses of numerous grammatical phenomena some well studied and some new the authors demonstrate the empirical and conceptual superiority of the simpler syntax approach simpler syntax is addressed to linguists of all persuasions it will also be of central interest to those concerned with language in psychology human biology evolution computational science and artificial intelligence

all social structures are essentially power structures dependent on energy the concept of power and the role of energy in social organization are crucial and timely concerns especially in light of the current apprehension about future energy resources in energy and structure richard n

adams argues that social power affects humanity's approach to ecological economic and political problems directing people to seek solutions that are often deceptively shortsighted adams an anthropologist proposes that social power is directly derived from control over energy processes he identifies how power and mentalistic structures constitute fundamental determinants that shape the lives of people at all stages of cultural development forcing them to accept alternatives often far removed from their desires his central thesis is that the amount of power in any system varies with the amount of control exercised over the environment and that increasing power and control lead to increasing centralization of decision making social marginalization and environmental despoliation thus the more highly developed societies by virtue of their greater controls are responsible for the greater ultimate subordination and destruction of human potential as humanity combines technological advances with a growing inability to exercise good judgment with respect to our own survival energy and structure begins with an examination of the basic theory of social power what it is and how it works adams defines and differentiates between the concepts of power and control authority and legitimacy power domains and levels he then examines the underlying metatheory of energetic and mentalistic structures and provides an analytic model of the evolution of power from the primitive band to modern nations he predicts the emergence of supranational blocs and discusses other future possibilities throughout his theoretical points are solidly supported by examples drawn from a wide range of cultures

cognitive science is a field that began with the realization that researchers in varied disciplines psychology artificial intelligence linguistics philosophy formal semantics neuroscience and others had taken on a common set of problems in representation and meaning in reasoning and language nevertheless cognitive science as a whole enjoys no common methodology or theoretical framework and is in danger of becoming even more fragmented with time there are two reasons for this first cognitive science is built on existing methodologies that have different historical origins ab a result the psychologist s truth is different from the linguist s truth the artificial intelligence researcher s truth is different from the philosopher s truth the neuroscientist s truth is different from the formal semanticist s truth all too often there is little or no recognition of the relevance of work in other disciplines to one s own concerns second cognitive scientists tend to develop theories around isolated problems for instance there are theories about how humans categorize concepts about how humans analyze linguistic expressions syntactically about how the english tense system works semantically about how humans reason about space or reason about time about how goal directed problem solving occurs about how the brain computes and so on
