this article reviews the role of imaging in particular radiography magnet resonance imaging computer tomography ultrasound and nuclear medicine for the diagnosis and monitoring of rheumatological disorders concentrating on rheumatoid arthritis inflammatory spondylarthropathies and gout this update discusses novel imaging techniques and their applications within rheumatology including the following dual energy computed tomography ct in the diagnosis of gout and detection of bone marrow oedema high resolution peripheral quantitative ct in the early detection of peri articular bone damage high field strength magnetic the role of imaging in rheumatology spans from the detection and characterization of macroanatomic and microanatomic changes in the joint and soft tissues in the pathophysiologic process to the use of the more advanced biomarkers of disease targeting signs of early onset and disease in at risk individuals
