this volume is a reference handbook focusing on diseases like marfan syndrome ehlers danlos syndrome loeys dietz syndrome and other heritable soft connective tissue diseases the book presents detailed information for both basic

scientists and for clinicians seeing patients it is also a stepping stone for new investigations and studies that goes beyond the facts about the composition and biochemistry of the connective tissue and extracellular matrix as the authors connect individual components to specific aspects of various soft tissue disorders and to the actual or potential treatment of them progress in heritable soft connective tissue diseases features very prominent physicians and scientists as contributors who bring their most recent discoveries to the benefit of readers their expertise will help clinicians with proper diagnosis of sometimes elusive and uncommon heritable diseases of soft connective tissues this book also offers an update on the pathophysiology of these diseases including an emphasis on unifying aspects such as connections between embryonic development of the different types of connective tissues and systems and the role of tgf beta in development and physiology of soft tissues this new set of data explains at least in part why many of these disorders are interconnected though the primary pathophysiological events such as gene mutations may be different for each disorder

Pathological Basis of the Connective Tissue Diseases

1992-01-01

connective tissue diseases ctds are often still poorly understood and always difficult to manage however they are now starting to become increasingly recognised a ctd is any disease that has the connective tissues of the body as a primary target of pathology and since these types of tissue include any kind of biological tissue with an extensive extra cellular matrix that supports binds together or protects organs ctds can prove constantly problematic many connective tissue diseases feature abnormal immune system activity with inflammation in tissues as a result of an immune system that is directed against one s own body tissues autoimmunity connective tissue diseases can be sometimes caused by environmental factors and can also have strong or weak inheritance risks ctds can be very severe in individuals of afro caribbean or south east asian origin therefore there is a very large market opening up for the management of these diseases in china singapore malaysia and the indian sub continent there is currently no compact handbook available on the diagnosis and subsequent management of these diseases and so given the prevalence of ctds in pockets around the whole world there is potentially an extensive global market rather than focusing on rheumatogists already familiar with ctd the book would be aimed more at the general clinician and practitioner equipping them to handle the requirements of the unique treatment as well as rheumatologist trainees and nurses wishing to specialise

connective tissues are essential for the physical functioning of the animals s body the condition of the various connective tissues is governed by biochemical factors anabolism and catabolism that are controlled by specific enzymes any change outside the normal range of metabolism for instance induced by immunological reactions may induce a pathological disturbance the result can be acute or chronic inflammation or loss of normal function expressed in loosening dilatation breaking wear stiffness shrinking scars stenosis and cirrhosis or any other kind of fibrosis a first step toward improving our understanding of the feedback mecha nism that maintains the biological status and texture of a given connective tissue is to combine what is known about synthesis and enzymatic degradation of the components of fibers and ground substance common pathological phenomena like chronic inflammation of immune reactions can be either the result of the cause of disturbances in the sensitive balance of connective tissue metabolism nowadays con nective tissues are less and less regarded as brady trophic tissue but rather as a stimulating and many sided problem of research before we can understand the pathogenesis of the connective tissue diseases that result in the destructive processes mentioned above basic research will be necessary this research will be furthered by a constant exchange of information and the results of observations to promote this exchange of information between scientists symposia on connective tissue research are organized at regular intervals
