plant breeding reviews presents state of the art reviews on plant genetics and the breeding of all types of crops by both traditional means and molecular methods many of the crops widely grown today stem from a very narrow genetic base understanding and preserving crop genetic resources is vital to the security of food systems worldwide the emphasis of the series is on methodology a fundamental understanding of crop genetics and applications to major crops

atomistic computer simulations are often at the heart of modern attempts to predict and understand the physical properties of real materials including the vast domain of metals and alloys historically highly simplified empirical potentials have been used to provide the interatomic forces needed to perform such simulations but true predictive power in these materials emanates from fundamental quantum mechanics in metals and alloys especially a viable path forward to the vastly larger length and time scales offered by empirical potentials while retaining the predictive power of quantum mechanics is to coarse grain the underlying electronic structure of the material and systematically derive quantum based interatomic potentials from first principles this book spans the entire process from foundation in fundamental theory to the development of accurate quantum based potentials for real materials to the wide spread application of the potentials to the atomistic simulation of structural thermodynamic defect and mechanical properties of metals and alloys

the physics of ordered materials is much better understood than that of disordered materials the lack of a long range periodic structure makes it difficult to develop the theory of disordered phases it is not surprising that it is often found difficult to interpret experimental data on these systems

chickpea is an important protein rich crop with considerable diversity present among 44 annual cicer species a large collection of

chickpea germplasm including wild cicer species has been conserved in different gene banks globally however the effective and efficient utilization of these resources is required to develop new cultivars with a broad genetic base using core and mini core collections chickpea researchers have identified diverse germplasm possessing various beneficial traits that are now being used in chickpea breeding further for chickpea improvement the genus cicer harbours alleles genes for tolerance resistance to various abiotic and biotic stresses as well as for agronomic and nutrition related traits recent advances in plant biotechnology have resulted in developing large number of markers specific to chickpea in addition to technological breakthrough in developing high throughput genotyping platforms for unlocking the genetic potential available in germplasm collections
