**Trends in Dermatoglyphic Research** 2012-12-06 the preparation of a volume of worldwide research contributions can be a time consuming task which is frequently more difficult than many other types of book this particular venture was made easier by the assistance of many people therefore we wish to acknowledge the suggestions academic support and direction of dr kenneth m weiss our american editor the assistance of the staff of the department of sociology and anthropology at the university of northern iowa particularly the generous and congenial efforts of ms rosemarie skaine and mrs heidi anderegg whose computer and deciphering skills may be legendary the kind responses to our long distance questions from mr martin scrivener of kluwer publications are much appreciated finally the efforts of dr paul t baker and dr ralph m garruto for their help in rounding out the final contents nmd ccp foreword among the many techniques developed by nineteenth century anatomists for the study of human morphological structures the analysis of dermatoglyphics has proven to be one of the most useful and durable the series of reports presented herein reflect the dynamism of the topic such analyses provide a valuable tool for measuring the genetic relatedness of human populations and an inexpensive technique for alerting us to the degree of genetic involvement in the causes of many diseases

Application and Methodological Perspectives in Dermatoglyphics 1994 explore the recent methodological advances in dermatoglyphics particularly genetics developmental variations ethnic variability inheritance forensic and clinical aspects of dermatoglyphics this volume is an aid to assist those who are engaged in application of dermatoglyphics especially in the field of human biology anthropology forensic science and medicine

*Progress in Dermatoglyphic Research* 1982 provides authoritative insights into dermatoglyphics scientific transistions over the past 150 years describes both practically and philosophically the role of dermatoglyphics within the overall spectrum of the modern day scientific revolution especially in biology medicine and computer science coverage includes issues of sampling methodology the teaching and dissemination of the principles and applications of dermatoglyphics the use of dermatoglyphics in population genetics mental disorders anthropology primatology and more features attempts to identify areas where changes or improvements are needed and proposes new directions for the future

*Recent Trends in Dermatoglyphic Research* 2018 the skin on the fingertips and palmar and plantar surfaces of man is not smooth it is grooved by curious ridges which form a variety of configurations these ridge configurations have attracted the attention of laymen for millenia they have also evoked the serious interest of scientists for more than three centuries the anatomist bidloo provided a description of ridge detail in the seventeenth century since then additional information has been added by anthropologists biologists and geneticists for the last century the fact that each individual's ridge configurations are unique has been utilized as a means of personal identification especially by law enforcement officials widespread medical interest in epidermal ridges developed only in the last several decades when it became apparent that many patients with chromosomal aberrations had unusual

ridge formations inspection of skin ridges therefore promised to provide a simple inexpensive means for determining whether a given patient had a particular chromosomal defect however the promise was only partially fulfilled because of the inherent variability of skin ridge configurations it was possible to draw conclusions about ridge abnormalities in groups of patients but not always in a given individual patients and clinicians became somewhat disenchanted with the clinical value of studying ridges

*Progress in Dermatoglyphic Research* Pcb 1982-04 dermatoglyphics in ancient greek derma skin glyptic carving is the scientific study of naturally occurring patterns on the surface of hands and feet dr harold cummins coined the term in 1926 and is regarded as the father of dermatoglyphics epidermal ridges on fingers palms toes and soles begin to develop during 3rd week of intrauterine life and development is complete by 19th week of gestation epithelium of primary palate finger bud and enamel most susceptible tissue to dental caries are ectodermal in origin develop from same site and same time of intrauterine life therefore genetic and environmental factors responsible for causing dental caries may also cause peculiarities in dermatoglyphic patterns present study explores the significance of dermatoglyphics in dental caries we support by means of dermatoglyphics that hereditary plays an important role in formation of dental caries

**Dermatoglyphics--fifty Years Later** 1979 a comprehensive review of the latest fingerprint development and imaging techniques with contributions from leading experts in the field fingerprint development techniques offers a comprehensive review of the key techniques used in the development and imaging of fingerprints it includes a review of the properties of fingerprints the surfaces that fingerprints are deposited on and the interactions that can occur between fingerprints surfaces and environments comprehensive in scope the text explores the history of each process the theory behind the way fingerprints are either developed or imaged and information about the role of each of the chemical constituents in recommended formulations the authors explain the methodology employed for carrying out comparisons of effectiveness of various development techniques that clearly demonstrate how to select the most effective approaches the text also explores how techniques can be used in sequence and with techniques for recovering other forms of forensic evidence in addition the book offers a guide for the selection of fingerprint development techniques and includes information on the influence of surface contamination and exposure conditions this important resource provides clear methodologies for conducting comparisons of fingerprint development technique effectiveness contains in depth assessment of fingerprint constituents and how they are utilized by development and imaging processes includes background information on fingerprint chemistry offers a comprehensive history the theory and the applications for a broader range of processes including the roles of each constituent in reagent formulations fingerprint development techniques offers a comprehensive guide to fingerprint development and imaging building on much of the previously unpublished research of the home office centre for applied science and technology

*Dermatoglyphics* 1991 no detailed description available for dermatoglyphics

Quantitative Dermatoglyphics 1983 this book has been written to cater to the needs of undergraduate and postgraduate students of anthropology and sociology it takes stock of the work done in the anthropology of north east india and deals in four sections with various aspects of this question section i focuses on prehistoric anthropology section ii looks at the colonial context and its effect on policy and perceptions about the north east section iii on biological anthropology and section iv on social anthropology

*Dermatoglyphics* 1978 since its publication the first edition of fingerprints and other ridge skin impressions has become a classic in the field this second edition is completely updated focusing on the latest technology and techniques including current detection procedures applicable processing and analysis methods all while incorporating the expansive growth of literature on the topic since the publication of the original edition forensic science has been challenged in recent years as a result of errors courts and other scientists contesting verdicts and changes of a fundamental nature related to previous claims of infallibility and absolute individualization as such

these factors represent a fundamental change in the way training identifying and reporting should be conducted this book addresses these questions with a clear viewpoint as to where the profession and ridge skin identification in particular must go and what efforts and research will help develop the field over the next several years the second edition introduces several new topics including discussion of ace v and research results from ace v studies computerized marking systems to help examiners produce reports new probabilistic models and decision theories about ridge skin evidence interpretation introducing bayesnet tools fundamental understanding of ridge mark detection techniques with the introduction of new aspects such as nanotechnology immunology and hyperspectral imaging overview of reagent preparation and application chapters cover all aspects of the subject including the formation of friction ridges on the skin the deposition of latent marks ridge skin mark identification the detection and enhancement of such marks as well the recording of fingerprint evidence the book serves as an essential reference for practitioners working in the field of fingermark detection and identification as well as legal and police professionals and anyone studying forensic science with a view to understanding current thoughts and challenges in dactyloscopy

Progress in Dermatoglyphic Research 1982 while the previous two volumes in this series were based upon methodology theory and the relationship between ecology and population structure this book can be viewed as an in depth case study the population genetics of a multitude of diverse groups geographically distributed throughout the world was examined in the first two volumes in contrast this volume focuses upon a single ethnic group the black caribs garifuna of central america and st vincent island and explores the interrelationships among the ethnohistory sociocultural characteristics demography morphology and genetic structure of the group this volume offers a broad and intensive treatment of the black caribs and their interactions with surrounding populations my interest in the genetics of the black caribs was sparked by an accidental meeting in amsterdam holland in march 1975 a conversation with nancie gonzalez at the applied anthropology meetings revealed the truth is stranger than fiction history of the black carib peoples of the caribbean this was a population with a small sized founding group and a unique biological success story nancie gonzalez was particularly interested in estimating the carib indian admixture in the contemporary garifuna population given my previous experience in estimating spanish and african admixture in the tlaxcaltecan population whose gene pool consisted predominantly of indian alleles a group that appeared to be primarily african with some indian admixture was of great interest aside from the ethnohistorical interest i believe that such a population may add considerably to our understanding of the inheritance of complex morphological traits

Dermatoglyphics in Medical Disorders 2012-12-06 this work presents a concise record of the origin of the fingerprint method of personal identification from its discovery in bengal in 1858 to its public demonstration there in 1877 the writer william james herschel is credited with being the first european to notice the value of fingerprints for identification he advocated that fingerprints were unique and permanent documenting his own fingerprints over his lifetime to ascertain

permanence
