Industrial process control (IPC) or simply process control is a system used in modern manufacturing which uses the principles of control theory and physical industrial control systems to monitor control and optimize continuous processes. Process control is a way to monitor and manage the conditions in which businesses make and transport products to ensure conformity and quality, limit waste, and increase efficiency. Process control is common in manufacturing and continuous production environments.

Process control involves tracking various parameters and variables within a process to ensure consistent quality and achieve desirable outcomes. It involves using control systems to maintain desired process conditions and ensure that products are produced consistently and efficiently.

Process control is all about using the best available control techniques for machinery and processing. The range of control techniques has improved dramatically in the recent past, and sites that are not taking advantage of modern process control start with basic process engineering, translating the engineering design and operating requirements into control objectives and requirements, designing the proper process control strategy, and control design. Process control illustrates that methodology with many practical examples that cover process control.
