grid computing denotes an approach to utilize distributed resources that are not subject to centralized control this approach fulfils computing requirements arising within the context of current high performance computing applications especially in the field of computational science and engineering this idea is analogous to an electric power network grid where power

generators are distributed but the users are able to access electric power without bothering about the source of energy and its location current grid enabling technologies consist of stand alone architectures a typical architecture provides middleware access to various services at different hierarchical levels computational grids enable the sharing selection and aggregation of a wide variety of geographically distributed computational resources such as supercomputers clusters of computers storage systems data sources instruments people etc and present them as a single unified resource for solving large scale computations and data intensive computing applications e g molecular modeling for drug design brain activity analysis high energy physics etc grid computing is a new emerging research area aiming to promote the development and advancement of technologies that provide seamless and scalable access to wide area distributed resources

astrometry is on the threshold of great changes due to the fact that this decade alone is witnessing an improvement of stellar positions equivalent to the total improvement of the previous two centuries the hipparcos satellite has concluded its observations and the catalog is in preparation preliminary results assure that the hipparcos catalog will provide positions parallaxes and annual proper motions for over 100 000 stars with accuracies of 1 5 milliarcseconds in addition the tycho catalog will provide positions of about 30 milliarcseconds accuracy for over 1 million stars and annual proper motions with 3

milliarcsecond accuracy will subsequently be obtained by means of first epoch positions from the astrographic catalog optical interferometers on the ground are beginning operation and these instruments can provide observational accuracies of approximately one milliarcsecond also the traditional reference frame based on the fundamental catalog of bright stars is being replaced by the extragalactic reference frame based on radio sources with accuracies of one milliarcsecond thus astrometry will change from a fundamental reference frame defined in terms of the dynamical reference frame of the solar system with accuracies of 100 milliarcseconds to a space fixed extragalactic reference frame with accuracies of one milliarcsecond future astrometric observations should be in the 1-100 milliarcsecond accuracy range there are a number of concepts for future astrometric instruments in space most of these can provide sub milliarcsecond astrometric accuracies
