Business Analysis For Dummies 2013-07-22

optical phase conjugation or time reversal of an optical wave front is an important technique to correct distortions in electromagnetic waves which are built up during propagation through a medium the authors have studied theoretically optical phase conjugation through four wave mixing in a slab of non linear material when two strong counter propagating laser beams irradiate a non linear crystal the third order susceptibility is activated and can couple to an external weak probe field a four wave mixing process then generates a phase conjugated or time reversed replica of this incident probe field they investigated the mechanism of the production of phase conjugated radiation in such a configuration by solving the non linear maxwell equations for the electric field the electric field in the material satisfies a set of two coupled wave equations which couple positive and negative frequency components of the electric field it is shown that the polarisation of the pumps and the tensorial nature of the interaction can be accounted for by a simple

polarisation operator in the wave equations maxwell s equations for the field in the layer admit plane wave solutions although the dispersion relations are very different from the usual linear relation between the frequency and the wave number the coupling between the two waves exhibits a strong resonance near the frequency of the pump beams these plane wave modes can be matched across the boundaries of the layer to the probe field the response of the material can then be expressed in terms of fresnel reflection and transmission coefficients for both s and p polarisation we have derived simple matrix equations for the set of fresnel coefficients which can be solved numerically and the have also obtained closed form analytical solutions for the various fresnel coefficients it is indicated that our solutions reduce to earlier results in the appropriate limits
