immunology is the study of our protection from foreign macromolecules or invading organisms and our responses to them these invaders include viruses bacteria protozoa or even larger parasites in addition we develop immune responses against our own proteins in autoimmunity and against our own aberrant cells in tumor immunity the body is defended by innate immune responses but these will only work to control pathogens that have certain molecular patterns or that induce interferons and other secreted yet non specific defenses they do not allow memory to form as they operate by receptors that are coded in the genome microbiology is the study of microorganisms that is the organisms which are of microscopic dimensions these organisms are too small to be clearly perceived by the unaided human eye if an object has a diameter of less than 0.1 mm the eye can not perceive it at all and very little detail can be perceived in an object with a diameter of 1 mm microorganisms benefit society by cycling inorganic and organic matter into molecules needed for life and detoxifying discarded wastes historically they have served as microscopic factories for the production of cheeses alcohol and antibiotics microorganisms have also been engineered to produce a wide variety of products for our benefit through the emergence of biotechnology microorganisms have however also inflicted great distress to human animal and plant populations through disease spoilage of crops foods and the fouling and degradation of man made structures the main aim of this book is to understand and interpret the major current topics in the field of immunology and microbiology

Textbook of Microbiology & Immunology

2009

this book provides an up to date information on microbial diseases which is an emerging health problem world over this book presents a comprehensive coverage of basic and clinical microbiology including immunology bacteriology virology and mycology in a clear and succinct manner the text includes morphological features and identification of each organism along with the pathogenesis of diseases clinical manifestations diagnostic laboratory tests treatment and prevention and control of resulting infections along with most recent advances in the field about the author subhash chandra parija md phd dsc frcpath is director professor and head department of microbiology jawaharlal institute of postgraduate medical education and research jipmer pondicherry india professor parija author of more than 200 research publications and 5 textbooks is the recipient of more than 20 national and international awards including the most prestigious dr bc roy national award of the medical council of india for his immense contribution in the field of medical microbiology

World of Microbiology and Immunology: A-L

2003

contains six hundred alphabetically arranged entries that provide information about topics in microbiology and immunology including profiles of pioneers in the field and features a historical chronology and general index

Review of Medical Microbiology and Immunology

2006

offers a review of the basic and clinical aspects of bacteriology virology mycology parasitology and immunology with an emphasis on the clinical application of microbiology and immunology to infectious diseases this title covers a usmle style exam with case based questions

Elsevier's Integrated Immunology and Microbiology

2007

case based questions at the end of each chapter enable students to gauge their mastery of the material and a colour coded format allows them to quickly find the specific guidance they need

expression of an immune response is the net result of complex synergistic and antagonistic activities performed by a variety of cell types it includes macrophages t and b populations which may interact in performance of a response and suppressor cells interfering with it accordingly a lack of response may not necessarily indicate absence of immunocompetent cells but rather nonexpression of competence thus one should consider two possible situations which are by no means mutually exclusive to account for immunologic unresponsiveness a one or more of the cell populations composing the synergistic unit is absent or immature and b an antagonistic unit which interferes with the response is dominating in view of this an approach to development of immune

reactivity necessitates parallel surveys of development of cells with the potential to perform as well as of cells which can suppress the response classification of the various cell types has been based so far on their phenotypic properties e g membrane antigen markers cell receptors production and secretion of immunoglobulins etc genotypically t and b cells may represent either separate independent cell lines or different stages of development within the same cell lineage
