presents a variety of compelling topics for a second course in statistics such as multiple regression nonparametric methods and survival analysis every topic is introduced in the context of a real world research question asking students to explore the concepts firsthand with guided activities and research projects the number of students taking ap statistics continues to rise and the number of students taking an introductory statistics course has more than doubled since 1990 as a result the goals of the second course have changed this course must engage students from multiple disciplines and demonstrate the broad applicability of statistics to their lives to that end this text takes an inquiry based approach that teaches advanced statistical techniques through group work and hands on exploration using real research questions the chapters are modular so that instructors can select only the topics relevant to their course and teach them in any order the only prerequisite is an algebra based introductory statistics or ap statistics course with examples from throughout europe and the united states the contributors to this volume explore how gender violence is framed through language and what this means for research and policy language shapes responses to abuse and approaches to perpetrators and interfaces with national debates about gender violence and social change many areas of mining engineering gather and use statistical information provided by observing the actual operation of equipment their systems the development of mining works surface subsidence that accompanies underground mining displacement of rocks surrounding surface pits and underground drives and longwalls amongst others in addition the actual modern machines used in surface mining are equipped with diagnostic systems that automatically trace all important machine parameters and send this information to the main producer's computer such data not only provide information on the technical properties of the machine but they also have a statistical character furthermore all information gathered during stand and lab investigations where parts assemblies and whole devices are tested in order to prove their usefulness have a stochastic character all of these materials need to be developed statistically and more importantly based on these results mining engineers must make decisions whether to undertake actions connected with the further operation of the machines the further development of the works etc for these reasons

knowledge of modern statistics is necessary for mining engineers not only as to how statistical analysis of data should be conducted and statistical synthesis should be done but also as to understanding the results obtained and how to use them to make appropriate decisions in relation to the mining operation this book on statistical analysis and synthesis starts with a short repetition of probability theory and also includes a special section on statistical prediction the text is illustrated with many examples taken from mining practice moreover the tables required to conduct statistical inference are included
