the algebra of square matrices of size n 2 over the field of complex numbers is evidently the best known example of a non commutative alge 1 bra subalgebras and subrings of this algebra for example the ring of n x n matrices with integral entries arise naturally in many areas of mathemat ics historically however the study of matrix algebras was preceded by the discovery of quatemions which introduced in 1843 by hamilton found ap plications in the classical mechanics of the past century later it turned out that quaternion analysis had important applications in field theory the al gebra of quaternions has become one of the classical mathematical objects it is used for instance in algebra geometry and topology we will briefly focus on other examples of non commutative rings and algebras which arise naturally in mathematics and in mathematical physics the exterior algebra or grassmann algebra is widely used in differential geometry for example in geometric theory of integration clifford algebras which include exterior algebras as a special case have applications in rep resentation theory and in algebraic topology the weyl algebra le algebra of differential operators with polynomial coefficients often appears in the representation theory of lie algebras in recent years modules over the weyl algebra and sheaves of such modules became the foundation of the so called microlocal analysis the theory of operator algebras le

this is the second of two volumes of a state of the art survey article collection which originates from three commutative algebra sessions at the 2009 fall southeastern american

mathematical society meeting at florida atlantic university the articles reach into diverse areas of commutative algebra and build a bridge between noetherian and non noetherian commutative algebra these volumes present current trends in two of the most active areas of commutative algebra non noetherian rings factorization ideal theory integrality and noetherian rings the local theory graded situation and interactions with combinatorics and geometry this volume contains surveys on aspects of closure operations finiteness conditions and factorization closure operations on ideals and modules are a bridge between noetherian and nonnoetherian commutative algebra it contains a nice guide to closure operations by epstein but also contains an article on test ideals by schwede and tucker and one by enescu which discusses the action of the frobenius on finite dimensional vector spaces both of which are related to tight closure finiteness properties of rings and modules or the lack of them come up in all aspects of commutative algebra however in the study of non noetherian rings it is much easier to find a ring having a finite number of prime ideals the editors have included papers by boynton and sather wagstaff and by watkins that discuss the relationship of rings with finite krull dimension and their finite extensions finiteness properties in commutative group rings are discussed in glaz and schwarz s paper and olberding s selection presents us with constructions that produce rings whose integral closure in their field of fractions is not finitely generated the final three papers in this volume investigate factorization in a broad sense the first paper by celikbas and eubanks turner discusses the partially ordered set of prime ideals of the projective line over the integers the editors have also included a paper on zero divisor graphs by coykendall sather wagstaff sheppardson and spiroff the final paper by chapman and krause concerns non unique factorization

classical harmonic analysis is an important part of modern physics and mathematics comparable in its significance with calculus created in the 18th and 19th centuries as a distinct mathematical discipline it continued to develop conquering new unexpected areas and producing impressive applications to a multitude of problems it is widely understood that the explanation of this miraculous power stems from group theoretic ideas underlying practically everything in harmonic analysis this book is an unusual combination of the general and abstract group theoretic approach with a wealth of very concrete topics attractive to everybody interested in mathematics mathematical literature on harmonic analysis abounds in books of more or less abstract or concrete kind but the lucky combination as in this volume can hardly be found

this book offers a review of the theory of locally convex quasi algebras authored by two of its contributors over the last 25 years quasi algebras are partial algebraic structures that are motivated by certain applications in mathematical physics they arise in a natural way by completing a algebra under a locally convex algebra topology with respect to which the multiplication is separately continuous among other things the book presents an unbounded representation theory of quasi algebras together with an analysis of normed quasi algebras their spectral theory and a study of the structure of locally convex quasi algebras special attention is given to the case where the locally convex quasi algebra is obtained by completing a c algebra under a locally convex algebra topology coarser than the c topology introducing the subject to graduate students and researchers wishing to build on their knowledge of the usual theory of banach and or locally convex algebras this approach is supported by basic results and a wide variety of examples
