immunologic diagnosis of endemic mycoses pmc *Jan 05 2024*

endemic mycoses result from infection mainly due to dimorphic fungi and continue to cause substantial morbidity and mortality especially in selected regions the diagnosis of endemic mycoses is typically achieved by an association of clinical epidemiological and laboratory information

endemic mycoses include diseases with a localized endemic area and a few of them converge these mycoses all have in common the airway involvement and can cause pulmonary symptoms following initial asymptomatic infection among the risk groups to acquire these mycoses are travelers from endemic areas archeologists speleologists and immigrants
