racist idea true racism is a frame of mind rather than a specialised discipline its influence thus extends to fields which according to general opinion and especially that of the so called intellectuals would seem to have nothing to do with problems of this kind here we speak about the formation of a mentality and of a sensibility not of intellectual schemes or of classifications of natural science it is to this end that we have written this small volume in which we will present in the most vivid and direct manner the fundamental essence of the ideas which integrate the racist orientation into the main issues of the ethics and the general world view of fascism

The Elements of Inorganic Chemistry 1869

the behavior of solid and liquid matter at high pressures and temperatures is best described in a phase diagram which shows the regions of stability of different phases of the material thanks to the diamond anvil cell which has made possible much higher pressures and to new and very accurate theoretical models and methods phase diagrams of the elements presents the most up to date information on the phase behavior of all the chemical elements from hydrogen to fermium the book summarizes with the aid of tables and illustrations the experimental data and the theoretical calculations each element is discussed in a separate section other chapters deal with methods the liquid vapor transition and an overview of the elements while comprehensively reviewing all that has been done in this important area the author also points to questions that need

much more experimental and theoretical work

based on an american chemical society symposium organized by professors glenn seaborg and oliver manuel this volume provides a comprehensive record of different views on this important subject at the end of the 20th century they have assembled a blend of highly respected experimentalists and theorists from astronomy geology meteoritics planetology and nuclear chemistry and physics to discuss the origin of elements in the solar system the intent was to include all points of view and

from the preface the major change in the format of the fifth edition is the presentation of the book in two volumes necessitated by the rapidly increasing knowledge of metabolism interactions and requirements of trace elements the guiding principle was to present the minimum of results that would serve as a logical foundation for the description of the present state of knowledge

the minimal polynomials of the images of unipotent elements in irreducible rational representations of the classical algebraic groups over fields of odd characteristic are found these polynomials have the form $t^d - 1$ and hence are completely determined by their degrees in positive characteristic the degree of such polynomial cannot exceed the order of a relevant element it occurs that for each unipotent element the degree of its minimal polynomial in an irreducible representation is equal to the order of this

element provided the highest weight of the representation is large enough with respect to the ground field characteristic on the other hand classes of unipotent elements for which in every nontrivial representation the degree of the minimal polynomial is equal to the order of the element are indicated in the general case the problem of computing the minimal polynomial of the image of a given element of order p^s in a fixed irreducible representation of a classical group over a field of characteristic $p > 2$ can be reduced to a similar problem for certain s unipotent elements and a certain irreducible representation of some semisimple group over the field of complex numbers for the latter problem an explicit algorithm is given results of explicit computations for groups of small ranks are contained in tables i xii the article may be regarded as a contribution to the programme of extending the fundamental results of hall and higman 1956 on the minimal polynomials from p solvable linear groups to semisimple groups

nearly three years have passed since the publication of the original russian edition in which time there have appeared various papers on recent research on the transuranium elements of which the most notable concern the production of element 105 at dubna and berkeley there has also been much fresh information on elements 104

kurchatovium and 103 lawrencium our knowledge of shell effects in the fission barrier has been extended hopes of finding relatively stable superheavy elements have stimulated searches for such elements in nature as well as rapid development in heavy ion acceleration we may see some very considerable discoveries in the next few years the new results vary in reliability and so it is not surprising that some papers on the properties of the heaviest elements have given rise to vigorous debates whose value lies in the way they advance the subject we have not attempted to give an exhaustive survey of recent papers and have merely added brief sections to reflect what we consider to be the most important points from these so far the united states and the ussr have made the most considerable contributions to the synthesis study and use of the transuranium elements so it is especially welcome to us that this book first published in our country should now appear in the usa in an english translation

the field of structural optimization is still a relatively new field undergoing rapid changes in methods and focus until recently there was a severe imbalance between the enormous amount of literature on the subject and the paucity of applications to practical design problems this imbalance is being gradually redressed there is still no shortage of new publications but there are also exciting applications of the methods of structural optimizations in the automotive aerospace civil engineering machine design and other engineering fields as a result of the growing pace of applications research into structural optimization methods is increasingly driven by real life problems t jost engineers who design structures employ complex general purpose software packages for structural analysis often they do not have any access to the source program and even more frequently they have only scant knowledge of the details of the structural analysis algorithms used in this software packages therefore the major challenge faced by researchers in structural optimization is to develop methods that are suitable for use with such software packages another major challenge is the high

computational cost associated with the analysis of many complex real life problems in many cases the engineer who has the task of designing a structure cannot afford to analyze it more than a handful of times

in the history of mathematics there are many situations in which calculations were performed incorrectly for important practical applications let us look at some examples the history of computing the number began in egypt and babylon about 2000 years bc since then many mathematicians have calculated e g archimedes ptolemy vi ete etc the first formula for computing decimal digits of π was discovered by j machin in 1706 who was the first to correctly compute 100 digits of π then many people used his method e g w shanks calculated with 707 digits within 15 years although due to mistakes only the first 527 were correct for the next examples we can mention the history of computing the fine structure constant that was first discovered by a sommerfeld and the mathematical tables exact calculations and formulas published in many mathematical textbooks were not verified rigorously 25 these errors could have a large effect on results obtained by engineers but sometimes the solution of such problems required such technology that was not available at that time in modern mathematics there exist computers that can perform various mathematical operations for which humans

are incapable therefore the computers can be used to verify the results obtained by humans to discovery new results to provetheresultsthatahumancanobtainwithoutanytechnology with respect to our example of computing we can mention that recently in 2002 y kanada y ushiro h kuroda and m

specialist periodical reports provide systematic and detailed review coverage of progress in the major areas of chemical research written by experts in their specialist fields the series creates a unique service for the active research chemist supplying regular critical in depth accounts of progress in particular areas of chemistry for over 80 years the royal society of chemistry and its predecessor the chemical society have been publishing reports charting developments in chemistry which originally took the form of annual reports however by 1967 the whole spectrum of chemistry could no longer be contained within one volume and the series specialist periodical reports was born the annual reports themselves still existed but were divided into two and subsequently three volumes covering inorganic organic and physical chemistry for more general coverage of the highlights in chemistry they remain a must since that time the spr series has altered according to the fluctuating degree of activity in various fields of chemistry some

titles have remained unchanged while others have altered their emphasis along with their titles some have been combined under a new name whereas others have had to be discontinued the current list of specialist periodical reports can be seen on the inside flap of this volume

new beginnings is the first book of the series the elements written by emilis navickas the book proposes the experiences of seven teenagers whose lives are about to undergo a radical change during an ordinary day while walking on the beach with her friends drake and john claudia s attention was caught by three shiny gems lying in the sand each of them decided to pick a gem completely unaware that their lives were about to change after a few moments the three friends were blindsided by a bright light coming from the gems little did they know that this was the exact moment in which their lives were about to change a new adventure made up of time traveling parallel worlds and superpowers was starting emilis navickas was born in lithuania europe on december 29th in 2004 he started writing at the age of 15 when he wrote his very first chapter since that day he knew that writing was his calling because not only was he able to put into words his emotions and feelings but he also wanted to invite readers into his realm of imagination after completing his first book he decided not to stop his story and start a new book

as an intensely practical religion buddhism has concentrated on devising a great number of meditations in recent years psychologists have shown great interest in the therapeutic value of

these meditations but accurate information about them has been hard to come by the most outstanding original documents have now been made accessible by edward conze who translated them from pali sanskrit and tibetan the volume originally published in 1956 also deals with the meaning of buddhist meditation and the relation of its methods and presuppositions to modern psychology
