The Julian and Modified Julian Dates 1998

for many astronomical and geodetic purposes it is important to know the time elapsed between the events under study the calendar we use today with its varying number of days in the month and complex rules governing leap years is most inconvenient for this purpose and so for much of the twentieth century astronomers have used the sequence of julian day numbers to denote the days beginning with greenwich mean noon on which events occur instants within a given day are assigned a julian date jd which is the julian day number plus the fraction of the day since the preceding noon and the time elapsed between two events is simply the difference between their jds

the margravia court astronomer simon marius was involved in all of the new observations made with the recently invented telescope in the early part of the seventeenth century he also discovered the moons of jupiter in january 1610 but lost the priority dispute with galileo galilei because he missed to publish his findings in a timely manner the history of astronomy neglected marius for a long time finding only the apologists for the copernican system worthy of attention in contrast the papers presented on the occasion of the simon marius anniversary conference 2014 and collected in this volume demonstrate that it is just this struggle to find the correct astronomical system that makes him particularly interesting his research into comets sunspots the moons of jupiter and the phases of venus led him to abandon the ptolemaic system and adopt the tyconic one he could not take the final step to heliocentricity but his rejection was based on empirical arguments of his time this volume presents a translation of the main work of marius and shows the current state of historical research on marius
