mathematics of complexity and dynamical systems is an authoritative reference to the basic tools and concepts of complexity systems theory and dynamical systems from the perspective of pure and applied mathematics complex systems are systems that comprise many interacting parts with the ability to generate a new quality of collective behavior through self organization e q the spontaneous formation of temporal spatial or functional structures these systems are often characterized by extreme sensitivity to initial conditions as well as emergent behavior that are not readily predictable or even completely deterministic the more than 100 entries in this wide ranging single source work provide a comprehensive explication of the theory and applications of mathematical complexity covering ergodic theory fractals and multifractals dynamical systems perturbation theory solitons systems and control theory and related topics mathematics of complexity and dynamical systems is an essential reference for all those interested in mathematical complexity from undergraduate and graduate students up through professional researchers

## PC Mag 1995-06-13

montreal has had a longstanding interest in somatostatin two years ago when the final planning began for the international con gress of endocrinology in quebec city in july 1984 we seized the op portunity for having a separate satellite symposium on somatostatin here in montreal we felt that after a decade of uniformly vigorous growth in somatostatin research the opportune moment had arrived for a review of the most significant past developments and for setting the directions for the future knowing the futility of trying to cover every aspect of the burgeoning somatostatin field in a two day scientific program we opted for a detailed analysis of selected areas which were reasonably mature and of areas of greatest new activity to attain these objectives 27 leading international experts actively involved in their fields were invited to present an indepth review of their work in one of five major categories of somatostatin research thirty minutes at the end of each session

were assigned for a three way comprehensive discussion of some of the core concepts between the session moderators the panellists and the audience the feedback that we have received from the particip ants leaves little doubt that the meeting was a scientific and social success this book fulfills our final commitment towards the meeting which was to record the proceedings in a timely publication

this books aims at giving an overview over theoretical and phenomenological aspects of particle astrophysics and particle cosmology to be of interest for both students and researchers in neighboring fields of physics it keeps a balance between well established foundations that will not significantly change in the future and a more in depth treatment of selected subfields in which significant new developments have been taking place recently these include high energy particle astrophysics such as cosmic high energy neutrinos the interplay between detection techniques of dark matter in the laboratory and in high energy cosmic radiation axion like particles and relics of the early universe such as primordial magnetic fields and gravitational waves it also contains exercises and thus will be suitable for both introductory and advanced courses in astroparticle physics
