compactness is related to a number of fundamental concepts of mathematics particularly important are compact hausdorff spaces or compacta compactness appeared in mathematics for the first time as one of the main topological properties of an interval a square a sphere and any closed bounded subset of a finite dimensional euclidean space once it was realized that precisely this property was responsible for a series of fundamental facts related to those sets such as boundedness and uniform continuity of continuous functions defined on them compactness was given an abstract definition in the language of general topology reaching far beyond the class of metric spaces this immensely extended the realm of application of this concept including in particular function spaces of quite general nature the fact that general topology provided an adequate language for a description of the concept of compactness and secured a natural medium for its harmonious development is a major credit to this area of mathematics the final formulation of a general definition of compactness and the creation of the foundations of the theory of compact topological spaces are due to p s aleksandrov and urysohn see aleksandrov and urysohn 1971

Proceedings of the Royal Horticultural Society 1864

this is the first of the encyclopaedia volumes devoted to general topology it has two parts the first outlines the basic concepts and constructions of general topology including several topics which have not previously been covered in english language texts the second part presents a survey of dimension theory from the very beginnings to the most important recent developments the principal ideas and methods are treated in detail and the main results are provided with sketches of proofs the authors have succeeded admirably in the difficult task of writing a book which will not only be accessible to the general scientist and the undergraduate but will also appeal to the professional mathematician the authors efforts to detail the relationship between more specialized topics and the central themes of topology give the book a broad scholarly appeal which far transcends narrow disciplinary lines

this book is designed for the reader who wants to get a general view of the terminology of general topology with minimal time and effort the reader whom we assume to have only a rudimentary knowledge of set theory algebra and analysis will be able to find what they want if they will properly use the index however this book contains very few proofs and the reader who wants to study more systematically will find sufficiently many references in the book key features more terms from general topology than any other book ever published short and informative articles authors include the majority of top researchers in the field extensive indexing of terms

geometric topology is a foundational component of modern mathematics involving the study of spacial properties and invariants of

familiar objects such as manifolds and complexes this volume which is intended both as an introduction to the subject and as a wide ranging resource for those already grounded in it consists of 21 expository surveys written by leading experts and covering active areas of current research they provide the reader with an up to date overview of this flourishing branch of mathematics

this third volume in Vladimir Tkachuk's series on CP theory problems applies all modern methods of CP theory to study compactness like properties in function spaces and introduces the reader to the theory of compact spaces widely used in functional analysis the text is designed to bring a dedicated reader from basic topological principles to the frontiers of modern research covering a wide variety of topics in CP theory and general topology at the professional level the first volume topological and function spaces 2011 provided an introduction from scratch to CP theory and general topology preparing the reader for a professional understanding of CP theory in the last section of its main text the second volume special features of function spaces 2014 continued from the first giving reasonably complete coverage of CP theory systematically introducing each of the major topics and providing 500 carefully selected problems and exercises with complete solutions this third volume is self contained and works in tandem with the other two containing five hundred carefully selected problems and solutions it can also be considered as an introduction to advanced set theory and descriptive set theory presenting diverse topics of the theory of function spaces with the topology of pointwise convergence or CP theory which exists at the intersection of topological algebra functional analysis and general topology

the book presents surveys describing recent developments in most of the primary subfields of general topology and its applications to algebra and analysis during the last decade it follows freely the previous edition north holland 1992 open problems in topology north holland 1990 and handbook of set theoretic topology north holland 1984 the book was prepared in connection with the Prague topological symposium held in 2001 during the last 10 years the focus in general topology changed and therefore the selection of

topics differs slightly from those chosen in 1992 the following areas experienced significant developments topological groups function spaces dimension theory hyperspaces selections geometric topology including infinite dimensional topology and the geometry of banach spaces of course not every important topic could be included in this book except surveys the book contains several historical essays written by such eminent topologists as r d anderson w w comfort m henriksen s mardešić j nagata m e rudin j m smirnov several reminiscences of l vietoris are added in addition to extensive author and subject indexes a list of all problems and questions posed in this book are added list of all authors of surveys a arhangel skii j baker and k kunen h bennett and d lutzer j dijkstra and j van mill a dow e glasner g godefroy g gruenhage n hindman and d strauss l hola and j pelant k kawamura h p kuenzi w marciszewski k martin and m mislove and m reed r pol and h torunczyk d repovs and p semenov d shakhmatov s solecki m tkachenko

a topological embedding is a homeomorphism of one space onto a subspace of another the book analyzes how and when objects like polyhedra or manifolds embed in a given higher dimensional manifold the main problem is to determine when two topological embeddings of the same object are equivalent in the sense of differing only by a homeomorphism of the ambient manifold knot theory is the special case of spheres smoothly embedded in spheres in this book much more general spaces and much more general embeddings are considered a key aspect of the main problem is taming when is a topological embedding of a polyhedron equivalent to a piecewise linear embedding a central theme of the book is the fundamental role played by local homotopy properties of the complement in answering this taming question the book begins with a fresh description of the various classic examples of wild embeddings i e embeddings inequivalent to piecewise linear embeddings engulfing the fundamental tool of the subject is developed next after that the study of embeddings is organized by codimension the difference between the ambient dimension and the dimension of the embedded space in all codimensions greater than two topological embeddings of compacta are approximated by nicer embeddings nice embeddings of polyhedra are tamed topological embeddings of polyhedra are approximated by piecewise linear embeddings and piecewise linear embeddings are locally unknotted complete details of the codimension three proofs including the requisite piecewise linear tools are provided the treatment of codimension two embeddings includes a self contained elementary exposition of the algebraic invariants needed to construct counterexamples to the approximation and existence of embeddings the treatment of codimension one embeddings includes the locally flat approximation theorem for manifolds as well as the characterization of local flatness in terms of local homotopy properties

separate and joint continuity presents and summarises the main ideas and theorems that have been developed on this topic which lies at the interface between general topology and functional analysis and the geometry of banach spaces in particular the book offers detailed self contained proofs of many of the key results although the development of this area has now slowed to a point where an authoritative book can be written many important and significant problems remain open and it is hoped that this book may serve as a springboard for future and emerging researchers into this area furthermore it is the strong belief of the authors that this area of research is ripe for exploitation that is to say it is their belief that many of the results contained in this monograph can and should be applied to other areas of mathematics it is hoped that this monograph may provide an easily accessible entry point to the main results on separate and joint continuity for mathematicians who are not directly working in this field but who may be able to exploit some of the deep results that have been developed over the past 125 years features provides detailed self contained proofs of many of the key results in the area suitable for researchers and postgraduates in topology and functional analysis is the first book to offer a detailed and up to date summary of the main ideas and theorems on this topic
