cerebral palsy in infancy is a thought provoking book which introduces a new way of thinking on the development and use of interventions relevant to current practice it advocates early targeted activity that is focused on increasing muscle activation training basic actions and minimizing or preventing mal adaptive changes to muscle morphology and function the authors present recent scientific findings in brain science movement sciences developmental biomechanics motor control mechanisms motor learning exercise science and muscle biology this knowledge provides the rationale for active intervention underpinning the need for an early referral to appropriate services the book features methods for promoting relatively intensive physical activity in young infants without placing a burden on parents which include assistive technologies such as robotics electronic bilateral limb trainers and

baby treadmills cerebral palsy in infancy begins by specifying the guidelines for training and exercise outlining the rationale for such intervention it goes on to cover the fundamentals of neuromotor plasticity and the development and negative effects of limited motor activity on brain organization and corticospinal tract development neuromuscular adaptations to impairments and inactivity are discussed along with the general movement assessment that can provide early diagnosis and prognosis facilitating very early referral from paediatric specialists to training programs the book ends with a section featuring various methods of training with the emphasis on preventing minimizing muscle contracture stimulating biomechanically critical muscle activity and joint movement an ideal clinical reference for those working to improve the lives of infants suffering from cerebral palsy contributors adel abduallah alhusaini saudi arabia david i anderson usa nicolas bayle france roslyn boyd australia giovanni cioni italy diane l damiano usa janet eyre uk linda feters usa mary galea australia andrew m gordon usa martin gough uk richard l lieber usa jens bo nielsen denmark micah perez australia caroline teulier france this book provides a comprehensive overview of the challenges of motor development and the consequent impact of poor motor function in later childhood for infants with cerebral palsy cp reviewed by oxford brookes university on behalf of the british journal of occupational therapy dec 2014 conceived and edited by roberta shepherd with contributions from internationally renowned expert clinicians and researchers discusses new research and new evidence based treatment interventions shows how to organize very early and intensive physical activity in young infants to stimulate motor development and growth therapies include the specificity of training and exercise with emphasis on promoting muscle activity and preventing contracture by active instead of passive stretching methods include new interactive technologies in enhancing home based training sessions carried out by the infant s family extensive referencing in each chapter for further study chapters feature annotations which illustrate scientific findings

## ***C is For Cerebral Palsy: A Child's View***

2019-08

over the last 25 years the definition and classification of cerebral palsy cp have evolved as well as the approach to rehabilitation cp is a disorder of the development of movement and posture causing activity limitations attributed to nonprogressive disturbances of the fetal or infant brain that may also affect sensation perception cognition communication and behavior motor control during reaching grasping and walking are disturbed by spasticity dyskinesia hyperreflexia excessive coactivation of antagonist muscles retained developmental reactions and secondary musculoskeletal malformations together with paresis and defective programming weakness and hypoextensibility of the muscles are due

not only to inadequate recruitment of motor units but also to changes in mechanical stresses and hormonal factors two methods the general movements assessment and the test of infant motor performance now permit the early detection of cp while the development of valid and reliable outcome measures particularly the gross motor function measure gmfm have made it possible to evaluate change over time and the effects of clinical interventions the gmfm has further led to the development of predictive curves of motor function while the gross motor classification system and the manual ability classification system provide standardized means to classify the severity of the movement disability with the emergence of the task oriented approach the focus of therapy in rehabilitation has shifted from eliminating deficits to enhancing function across all performance domains by emphasizing fitness function participation and quality of life there is growing evidence supporting selected interventions and interest for the therapy and social integration of adults with cp
