"Taxes Covered" 2011

the substantive scope of a tax treaty determines the extent of protection it can provide against international double taxation countries worldwide have adopted the text of art 2 taxes covered of the oecd model tax conventions in their bilateral tax treaties however the structure and wording of art 2 which have remained virtually unchanged since the beginnings of tax treaty law in the 1920s create interpretive issues and uncertainties in practical treaty application this book not only provides in depth analysis of recent case law and academic literature but also sheds light on the background to the standard formulations so widely used in the provision on the substantive scope of today s tax treaties the source documents used have rarely found their way into publications before historical oec and oecd reports and minutes originally largely classified as restricted and thus inaccessible to the public for decades provide an insight into the drafting process of art 2 and the discussions of delegates from various nations on practical implications for treaty application the book offers a unique perspective on this core treaty provision and aims to provide guidance for determining the taxes covered in any tax treaty page 4 of cover

despite being an accepted construct in traffic and transport psychology the precise nature of behavioural adaptation including its causes and consequences has not yet been established within the road safety community a comprehensive collection of recent literature behavioural adaptation and road safety theory evidence and action explores behavioural adaptation in road users it examines behavioural adaptation within the context of historical and theoretical perspectives and puts forth tangible and practical solutions that can effectively address adverse behavioural adaptation to road safety interventions before it occurs edited by christina rudin brown and samantha jamson with chapters authored by leading road safety experts in driver psychology and behaviour the book introduces the concept of behavioural adaptation and details its more relevant issues it reviews the definition of behavioural adaptation that was put forward by the oecd in 1990 and then puts this definition through its paces identifying where it may be lacking and how it might be improved this sets the context for the remaining chapters which take the oecd definition as their starting points the book discusses the various theories and models of behavioural adaptation and more general theories of driver behaviour developed during the last half century it provides examples of the evidence for behavioural adaptation instances in which behavioural adaptation arose as a consequence of the introduction of safety countermeasures the book then focuses on the internal human element and considers countermeasures that might be used to limit the development of behavioural adaptation in various road user groups the book concludes with practical tools and methodologies to address behavioural adaptation in research and design and to limit the potential negative effects before they happen supplying easy to understand accessible solutions that can be implemented early on in a road safety intervention s design or conception phase the chapters represent the most extensive compilation of literature relating to behavioural adaptation and its consequences since the 1990 oecd report the book brings together earlier theories of behavioural adaptation with more recent theories in the area and combines them with practical advice methods and tangible solutions that can minimise the potential negative impact of behavioural adaptation on road user safety and address it before it occurs it is an essential component of any road safety library and should be of particular relevance to researchers practitioners designers and policymakers who are interested in maximizing safety while at the same time encouraging innovation and excellence in road transport related design

manuela spangler deals with the default risk modelling of german covered bonds pfandbriefe existing credit risk models are not suitable for this purpose as they only consider the creditworthiness of the issuer while product specific features are not taken into account the author develops a multi period simulation based pfandbrief model which adequately accounts for the product s most important characteristics and risks the model provides a flexible framework for structural analyses and can be easily extended for tailor made investigations while the focus of the work is on the specification of the model itself simulation results from an exemplary model calibration are also discussed about the author manuela spangler works as a quantitative risk analyst for a large asset management company and holds a phd in mathematics from the university of augsburg prior to her current position she worked as a risk manager and financial engineer in the banking and insurance sector for various years

this paper considers the case for mortgage covered bonds as an alternative to the originate to distribute mortgage funding model it argues that the economic incentives provided to market participants under the covered bonds model are less susceptible to moral hazard even while retaining the key benefits of securitization such as capital market funding and flexibility in risk allocation notwithstanding these advantages however limited market size and the greater pro cyclicalities of mortgage loan quality in the united states potentially reflecting borrower incentives under the personal bankruptcy framework impose limits on the benefits ensuing from this model the analysis underscores the need for a comprehensive legal regulatory framework to underpin market development and discusses a number of ways in which the current draft legislation may be further strengthened a potential strategy to hasten market development within the current institutional framework is identified

wireless sensor networks have received significant attention because of their important role and many conveniences in our lives indeed the recent and fast advances in inexpensive sensor technology and wireless communications has made the design and development of large scale wireless sensor networks cost effective and appealing to a wide range of mission critical situations including civilian natural industrial and military applications such as health and environmental monitoring seism monitoring industrial process automation and battlefields surveillance respectively a wireless sensor network consists of a large number of tiny low powered devices called sensors which are randomly or deterministically deployed in a field of interest while collaborating and coordinating for the successful accomplishment of their mission these sensors suffer from very scarce resources and capabilities such as bandwidth storage cpu battery power or energy sensing and communication to name a few with energy being the most critical one the major challenge in the design process of this type of network is mainly due to the limited capabilities of the sensors and particularly their energy which makes them unreliable this book aims to develop a reader s thorough understanding of the opportunities and challenges of k covered wireless sensor networks where each point in a deployment field is covered or sensed by at least k sensors following rené descartes most elegant methodology of dividing each difficulty into as many parts as might be possible and necessary to best solve it discours de la method 1637 this book presents a variety of theoretical studies based on percolation theory and computational geometry as well as protocols that lead to the design of a unified framework where connected k coverage sensor scheduling and data routing and dissemination are jointly considered

software development for the automotive domain has become the enabling technology for almost all safety critical and comfort functions offered to the customer. ninety percent of all innovations in automotive systems are directly or indirectly enabled by embedded software. the numbers of serious accidents have declined in recent years despite constantly increasing traffic. this is correlated with the introduction of advanced software enabled functionality for driver assistance such as electronic stability control. software contributes significantly to the automotive value chain. by 2010 it is estimated that software will make up 40% of the value creation of automotive electronics. however, with the large number of software enabled functions, their interactions and the corresponding networking and operating infrastructure come significant complexities both during the automotive systems engineering process and at runtime. a central challenge for automotive systems development is the scattering of functionality across multiple subsystems such as electronic control units (ECUs) and the associated networks. as an example, consider the central locking systems (CLS) whose functionality is spread out over up to 19 different ECUs. in some luxury cars, of course, this includes advanced functionality such as seat positioning and radio tuning according to driver presets upon entry, as well as unlocking in case of a detected impact or accident. however, this example demonstrates that modern automotive systems bridge comfort and safety critical functionality. this induces particular demands on safety and security and, in general, software and systems quality. the resulting challenges and opportunities were discussed in depth at the second automotive software workshop, San Diego (ASWS), 2006, on whose results we report here.

from a macarthur genius mit economist and pre-eminent stanford economist comes a lively and provocative proposal for american health insurance reform. few of us need convincing that the american health insurance system needs reform, but many of the existing proposals focus on expanding one relatively successful piece of the system or building in piecemeal additions. these proposals miss the point, as the stanford health economist Liran Einav and the mit economist and macarthur genius Amy Finkelstein argue. our health care system was never deliberately designed but rather pieced together to deal with issues as they became politically relevant. the result is a sprawling yet arbitrary and inadequate mess. it has left 30 million americans without formal insurance. many of the rest live in constant danger of losing their coverage if they lose their job, give birth, get older, get healthier, get richer, or move. it's time to tear it all down and rebuild sensibly and deliberately, marshaling original research, striking insights from american history, and comparative analysis of what works and what doesn't from systems around the world. Einav and Finkelstein argue for automatic, basic, and free universal coverage for everyone, along with the option to buy additional supplemental coverage. their wholly original argument and comprehensive blueprint for an american universal health insurance system will surprise and provoke. we've got you covered is an erudite yet lively and accessible prescription we cannot afford to ignore.
