Resistance 2013-06-29 resistance and the process of therapeutic change paul I wachtel psychotherapy whether practiced from a psychodynamic or a behavioral point of view is rarely as straightforward as textbooks and case reports usually seem to imply more often the work proceeds in fits and starts and often does not seem to be proceeding at all but rather unraveling or moving backward the typical case is in fact quite atypical almost all cases present substantial difficulties for which the therapist feels at least some of the time quite unprepared practicing psychotherapy is a difficult if also rewarding way to earn a living it is no profession for the individual who likes certainty predictability or a fairly constant sense that one knows what one is doing there are few professions in which feeling stupid or stymied is as likely to be a part of one s ordinary professional day even for those at the pinnacle of the field indeed i would be loath to refer a patient to any therapist who declared that he almost always felt effective and clear about what was going on such a feeling can be maintained i believe only by an inordinate amount of bravado and lack of critical self reflection but the therapist trying to get some ideas about how to work with 1 these are of course not the only two points of view in psychotherapy nor do i believe they are the only two of value
