there is science and there is religion and never the twain shall meet is that to be the fate of these two disciplines having one foot in the religious world and the other in the scientific can be as precarious as attempting to remain astride two logs in a river in this sequel to a user s guide to our present world what everyone should know about religion and science complexions of what religion and science look like today are investigated it discusses topics from jesus and family values evangelists who arrive at your door discrimination and racism and the dark side for religion to delicate balances impacting us and the world climate change the pandemic and how ancient structures like stonehenge and the pyramids could have been built for science the study then turns to theological implications of scientific theories including relativity and quantum sure to ruffle the feathers of some from both sides the examination focuses on how scientific paradigms fail to cohere with traditional theological doctrines and presents the potentially uncomfortable view that scientific revolutions might warrant a corresponding revolution for theology itself

this book arose from courses taught by the authors and is designed for both instructional and reference use during and after a first course in algebraic topology it is a handbook for users who want to calculate but whose main interests are in applications using the current literature rather than in developing the theory typical areas of applications are differential geometry and theoretical physics we start gently with numerous pictures to illustrate the fundamental ideas and constructions in homotopy theory that are needed in later chapters we show how to calculate homotopy groups homology groups and cohomology rings of most of the major theories exact homotopy sequences of fibrations some important spectral sequences and all the obstructions that we can compute from these our approach is to mix illustrative examples with those proofs that actually develop transferable calculational aids we give extensive appendices with notes on background material extensive tables of data and a thorough index audience graduate students and professionals in mathematics and physics

spectral sequences are among the most elegant and powerful methods of computation in mathematics this book describes some of the most important examples of spectral sequences and some of their most spectacular applications the first part treats the algebraic foundations for this sort of homological algebra starting from informal calculations the heart of the text is an exposition of the classical examples from homotopy theory with chapters on the lera y serre spectral sequence the eilenberg moore spectral sequence the adams spectral sequence and in this new edition the bockstein spectral sequence the last part of the book treats applications throughout mathematics including the theory of knots and links algebraic geometry differential geometry and algebra this is an excellent reference for students and researchers in geometry topology and algebra
