the european standard en 9100 is the industry specific norm of the aerospace and defence industry for cooperation with an aerospace company certification according to this standard is usually mandatory for suppliers this book provides support in understanding and implementing the standard or when switching from iso 9001 2015 to en 9100 2018 after an introduction to the iso 9001 the emphasis is placed on the core characteristics of en 9100 and en 9120 the book focuses primarily on the

explanation and translation of the standards text into the language of everyday business the structure of the book strictly follows that of en 9100 2018 numerous practical examples facilitate the understanding and implementation in your own company where appropriate special characteristics of the distributor standard en 9120 are also discussed finally the author describes the certification process in great detail this includes the preparation the selection of a certification auditor and a certification body as well as the execution of the audit including process measurements the handling of nonconformities and the issuing of the certificate due to the high degree of congruence between the standards of the en 9100 series this book is also suitable as a guideline for the en 9110 for maintenance organisations and the en 9120 for distributors the target group this textbook is aimed at employees working in the quality department of suppliers in the aerospace industry

the importance of proper geometric dimensioning and tolerancing as a means of expressing the designer s functional intent and controlling the inevitable geometric and dimensional variations of mechanical parts and assemblies is becoming well recognized the research efforts and innovations in the field of tolerancing design the development of supporting tools techniques and algorithms and the significant advances in computing software and hardware all have contributed to its recognition as a viable area of serious scholarly contributions the field of tolerancing design is successfully making the transition to maturity where deeper insights and sound theories are being developed to offer explanations and reliable implementations are introduced to provide solutions machine designers realized very early that manufacturing processes do not produce the nominal dimensions of designed parts the notion of associating a lower and an upper limit referred to as tolerances with each dimen sion was introduced tolerances were specified to ensure the proper function of mating features fits of mating features included clearances location fits and interference fits with various sub grades in each category assigned a tolerance value depending on the nominal size of the mating features during the inspection process a part is rejected if a dimension fell outside the specified range as the accuracy requirements in assemblies became tighter designers had to consider other critical dimensions and allocate tolerances to them in order to ensure the assembly s functionality
