this collection of contributions on the subject of the neural mechanisms of sensorimotor control resulted from a conference held in cairns australia september 3 6 2001 while the three of us were attending the international union of physiological sciences iups congress in st petersburg russia in 1997 we discussed the implications of the next congress being awarded to new zealand we agreed to organise a satellite to this congress in an area of mutual interest the neuroscience of movement and sensation australia has a long standing and enviable reputation in the field of neural mechanisms of sensorimotor control arguably this reached its peak with the award of a nobel prize

to sir john eccles in 1963 for his work on synaptic transmission in the central nervous system since that time the subject of neuroscience has progressed considerably one advance is the exploitation of knowledge acquired from animal experiments to studies on conscious human subjects in this development australians have achieved international prominence particularly in the areas of kinaesthesia and movement control this bias is evident in the choice of subject matter for the conference and subsequently this book it was also decided to assign a whole section to muscle mechanics a subject that is often left out altogether from conferences on motor control cairns is a lovely city and september is a good time to visit it

the ability to use tools skillfully is generally regarded as one of the major achievements in the evolutionary development of the human nervous system it is possible for controlled movements of muscles to be executed only if sensory information is integrated into complex neural circuits at various hierarchical levels the chapters in this volume deal with basic and clinical aspects of integrative processing of sensory and motor activities new findings emphasize the important influence of somatosensory activity such as tactile proprioceptive noxious cutaneous and articular input on motor output furthermore recordings of evoked potentials as well as unit recordings indicate that sensory and cortical activities are highly interrelated control of muscles by motoneurons is exerted both electrically and chemically disturbed muscle motoneuron interaction is reflected in ultrastructural motoneuron morphology and may be of importance in the pathogenesis of motoneuron disease long loop reflex testing under various pathological conditions provides insight into disturbed sensory motor circuitry in humans electrophysiological recording as well as neurochemical and immunohistochemical studies elucidate the neural circuitry of basal ganglia and their neural connections thus providing improved therapeutic concepts the role of the thalamus and thalamocortical connections in sensory motor processing is of particular interest because motor disturbances such as tremor or dystonia can be effectively relieved by stereotaxic interventions at the subthalamic or thalamic level

sensorimotor focused emdr combines two hugely influential and effective therapies emdr therapy and sensorimotor psychotherapy to provide a new approach in doing so the book supports the widely held view of psychotherapists that in trauma the primary store of neurological information is somatic rather than cognitive many therapists trained in emdr find that additional resources are needed for patients who present with symptoms of complex trauma and dissociation this is because emdr is primarily a top down approach based on cbt with the addition of bilateral stimulation bls in visual tactile and auditory modalities by contrast sensorimotor focused emdr takes a body based and bottom up approach that seeks to resolve trauma by reprocessing information at multiple levels in the gut brain the heart brain and the head brain as well as in the endocrine immune and nervous systems fully revised since the art of bart 2015 the book looks at the latest advances in neuroscience including research into the effectiveness of psychotherapy and the mysteries of consciousness and the development of mind it also looks at the role of newly discovered organs the mesentery and the interstitium and provides clear anatomical evidence for the communication of biophotons in energy channels known as the primo vascular system sf emdr is the only therapy that fully integrates western theories of affective neuroscience with eastern observations on activation of chakras pranas and energies and in doing so it offers strong potential for enhanced outcomes and optimized performance for patients
