endocrinology of the vasculature is the first book to comprehensively and systematically explore the vasculature as an endocrine organ

revised edition of Oxford handbook of key clinical evidence edited by James Harrison et al 2009 the publication of the extensive seven volume work Comprehensive Molecular Insect Science provided a complete reference encompassing important developments and achievements in modern insect science one of the most swiftly moving areas in entomological and comparative research is endocrinology and this volume Insect Endocrinology is designed for those who desire a comprehensive yet concise work on important aspects of this topic because this area has moved quickly since the original publication articles in this new volume are revised highlighting developments in the related area since its original publication Insect Endocrinology covers the mechanism of action of insect hormones during growth and metamorphosis as well as the role of insect hormones in reproduction diapause and the regulation of metabolism contents include articles on the juvenile hormones circadian organization of the endocrine system ecdysteroid chemistry and biochemistry as well as new chapters on insulin like peptides and the peptide hormone bursicon this volume will be of great value to senior investigators graduate students post doctoral fellows and advanced undergraduate research students it can also be used as a reference for graduate courses and seminars on the topic chapters will also be valuable to the applied biologist or entomologist providing the requisite understanding necessary for probing the more applied research areas articles selected by the known and respected editor in chief of the original major reference work Comprehensive Molecular Insect Science newly revised contributions bring together the latest research in the quickly moving field of insect endocrinology review of the literature of the past five years is now included as well as full use of data arising from the application of molecular technologies wherever appropriate

in the last two decades due to the continuous increase of lifespans in western societies and the consequent growing of the elderly population have witnessed an increase in the number of studies on biological and molecular factors able to promote healthy aging and reach longevity the study of the genetic component of human longevity demonstrated that it accounts for 25 of intra population phenotype variance the efforts made to characterize the genetic determinants suggested that the maintenance of cellular integrity inflammation oxidative stress response dna repair as well as the use of nutrients represent the most important pathways correlated with a longer lifespan however although a plethora of variants were indicated to be associated with human longevity only very

few were successfully replicated in different populations probably because of population specificity missing heritability as well as a complex interaction among genetic factors with lifestyle and cultural factors which modulate the individual chance of living longer thus many challenges remain to be addressed in the search for the genetic components of human longevity this special issue is aimed to unify the progress in the analysis of the genetic determinants of human longevity to take stock of the situation and point to future directions of the field we invite submissions for reviews research articles short communications dealing with genetic association studies in human longevity including all types of genetic variation as well as the characterization of longevity related genes
