as the major task of sequencing the human genome is near completion and full complement of human genes are catalogued attention will be focused on the ultimate goal to understand the normal biological functions of these genes and how alterations lead to disease states in this task there is a severe limitation in working with human material but the mouse has been adopted as the favored animal model because of the available genetic resources and the highly conserved gene conservation linkage organization in just of ten years since the first gene targeting experiments were p formed in embryonic stem es cells and mutations transmitted through the mouse germline more than a thousand mouse strains have been created these achievements have been made possible
