the present volume is based on the proceedings of the 12th workshop of the infn eloisatron project held at the ettore majorana centre for scientific culture emcsc erice frapani sicily italy in the period september 15 20 1990 the proceedings deal with the presentation of new technologies for supercolliders three new energy frontiers 16 40 and 200 tev are now opened up for the future of subnuclear physics basic problems above the fermi energy are crowding up but no one knows the energy levels needed for their solution this is why the technology for experiments with the new generation of supercolliders needs to be pursued having in mind the problems which are of common interest in the three energy frontiers the primary purpose of the workshop was to contribute towards the highest energy limit in the search for new instruments and new technologies furthermore the present status and performances of various detector technologies were reviewed the possible options for a powerful apparatus whose goal would be the discovery of the top higgs and susy particles in a very high energy high rate environment were finally analysed the workshop was sponsored by the italian national institute for nuclear physics infn the italian ministry of education the italian ministry of scientific and technological research and the sicilian regional government we are thankful to the staff of emcsc for their efficient and warm support

in everyday life and particularly in the modern workplace information technology and automation increasingly mediate augment and sometimes even interfere with how humans interact with their environment how to understand and support cognition in human technology interaction is both a practically and socially relevant problem the chapters in this volume frame this problem in adaptive terms how are behavior and

cognition adapted or perhaps ill adapted to the demands and opportunities of an environment where interaction is mediated by tools and technology the authors draw heavily on the work of egon brunswik a pioneer in ecological and cognitive psychology as well as on modern refinements and extensions of brunswikian ideas including hammond s social judgment theory gigerenzer s ecological rationality and anderson s rational analysis inspired by brunswik s view of cognition as coming to terms with the casual texture of the external world the chapters in this volume provide quantitative and computational models and measures for studying how people come to terms with an increasingly technological ecology and provide insights for supporting cognition and performance through design training and other interventions the methods models and measures presented in this book provide timely and important resources for addressing problems in the rapidly growing field of human technology interaction the book will be of interest to researchers students and practitioners in human factors cognitive engineering human computer interaction judgment and decision making and cognitive science
